<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

## Examples using `matplotlib.axes.Axes.cohere`

### `matplotlib.axes.Axes.csd`

```
Axes.csd(self, x, y, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)
```

Plot the cross-spectral density.

The cross spectral density  $P_{xy}$  by Welch's average periodogram method. The vectors  $x$  and  $y$  are divided into  $NFFT$  length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The product of the direct FFTs of  $x$  and  $y$  are averaged over each segment to compute  $P_{xy}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < NFFT$  or  $\text{len}(y) < NFFT$ , they will be zero padded to  $NFFT$ .

#### Parameters

##### `x, y`

[1-D arrays or sequences] Arrays or sequences containing the data.

##### `Fs`

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.

##### `window`

[callable or ndarray, default: `window_hanning`] A function or a vector of length  $NFFT$ . To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to *NFFT*.

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz<sup>-1</sup>. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between segments.

**Fc**

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**return\_line**

[bool, default: False] Whether to include the line object plotted in the returned values.

**Returns**

**Pxy**

[1-D array] The values for the cross spectrum  $P_{xy}$  before scaling (complex valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in  $P_{xy}$ .

**line**

[*Line2D*] The line created by this function. Only returned if *return\_line* is True.

**Other Parameters****\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,

## Examples using `matplotlib.axes.Axes.csd`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_csd\_demo.py

### `matplotlib.axes.Axes.magnitude_spectrum`

`Axes.magnitude_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, *, data=None, **kwargs)`

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

#### Parameters

##### `x`

[1-D array or sequence] Array or sequence containing the data.

##### `Fs`

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

##### `window`

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

##### `sides`

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

##### `pad_to`

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

##### `scale`

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale, i.e., the dB amplitude ( $20 * \log_{10}$ ). 'default' is 'linear'.

**Fc**

[int, default: 0] The center frequency of  $x$ , which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns****spectrum**

[1-D array] The values for the magnitude spectrum before scaling (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**line**

[*Line2D*] The line created by this function.

**Other Parameters****\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description

**See also:****`psd`**

Plots the power spectral density.

**`angle_spectrum`**

Plots the angles of the corresponding frequencies.

**`phase_spectrum`**

Plots the phase (unwrapped angle) of the corresponding frequencies.

**`specgram`**

Can plot the magnitude spectrum of segments within the signal in a colormap.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.magnitude_spectrum`

### `matplotlib.axes.Axes.phase_spectrum`

`Axes.phase_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)`

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

#### Parameters

##### `x`

[1-D array or sequence] Array or sequence containing the data

##### `Fs`

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.

##### `window`

[callable or ndarray, default: `window_hanning`] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

##### `sides`

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

##### `pad_to`

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in

the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

**Fc**

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns****spectrum**

[1-D array] The values for the phase spectrum in radians (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**line**

[*Line2D*] The line created by this function.

**Other Parameters****\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,

See also:

**`magnitude_spectrum`**

Plots the magnitudes of the corresponding frequencies.

**`angle_spectrum`**

Plots the wrapped version of this function.

**`specgram`**

Can plot the phase spectrum of segments within the signal in a colormap.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.phase_spectrum`

### `matplotlib.axes.Axes.psd`

```
Axes.psd(self, x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)
```

Plot the power spectral density.

The power spectral density  $P_{xx}$  by Welch's average periodogram method. The vector  $x$  is divided into `NFFT` length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The  $|\text{fft}(i)|^2$  of each segment  $i$  are averaged to compute  $P_{xx}$ , with a scaling to correct for power loss due to windowing.

If `len(x) < NFFT`, it will be zero padded to `NFFT`.

#### Parameters

##### `x`

[1-D array or sequence] Array or sequence containing the data

##### `Fs`

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.

##### `window`

[callable or ndarray, default: `window_hanning`] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

##### `sides`

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to  $NFFT$ .

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use `pad_to` for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz<sup>-1</sup>. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between segments.

**Fc**

[int, default: 0] The center frequency of  $x$ , which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**return\_line**

[bool, default: False] Whether to include the line object plotted in the returned values.

**Returns****Pxx**

[1-D array] The values for the power spectrum  $P_{xx}$  before scaling (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in  $P_{xx}$ .

**line**

[[Line2D](#)] The line created by this function. Only returned if `return_line` is True.

**Other Parameters****\*\*kwargs**

Keyword arguments control the [Line2D](#) properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3), bool or None

**`specgram`**

Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

**`magnitude_spectrum`**

Plots the magnitude spectrum.

**`csd`**

Plots the spectral density between two signals.

## Notes

For plotting, the power is plotted as  $10 \log_{10}(P_{xx})$  for decibels, though  $P_{xx}$  itself is returned.

## References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

---

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

## Examples using `matplotlib.axes.Axes.psd`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_psd\_demo.py

## `matplotlib.axes.Axes.specgram`

```
Axes.specgram(self, x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None,
              nooverlap=None, cmap=None, xextent=None, pad_to=None, sides=None,
              scale_by_freq=None, mode=None, scale=None, vmin=None, vmax=None, *,
              data=None, **kwargs)
```

Plot a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*. The spectrogram is plotted as a colormap (using imshow).

### Parameters

#### x

[1-D array or sequence] Array or sequence containing the data.

#### Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

#### window

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

#### sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

#### pad\_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is None, which sets *pad\_to* equal to *NFFT*

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use `pad_to` for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the `detrend` parameter is a vector, in Matplotlib is it a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz<sup>-1</sup>. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**mode**

[{'default', 'psd', 'magnitude', 'angle', 'phase'}] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

**noverlap**

[int, default: 128] The number of points of overlap between blocks.

**scale**

[{'default', 'linear', 'dB'}] The scaling of the values in the `spec`. 'linear' is no scaling. 'dB' returns the values in dB scale. When `mode` is 'psd', this is dB power ( $10 * \log_{10}$ ). Otherwise this is dB amplitude ( $20 * \log_{10}$ ). 'default' is 'dB' if `mode` is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if `mode` is 'angle' or 'phase'.

**Fc**

[int, default: 0] The center frequency of `x`, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**cmap**

[`Colormap`, default: `rcParams["image.cmap"]`] (default: 'viridis')

**xextent**

[*None* or (xmin, xmax)] The image extent along the x-axis. The default sets `xmin` to the left border of the first bin (`spectrum` column) and `xmax` to the right border

of the last bin. Note that for  $noverlap > 0$  the width of the bins is smaller than those of the segments.

### \*\*kwargs

Additional keyword arguments are passed on to `imshow` which makes the spectrogram image. The `origin` keyword argument is not supported.

## Returns

### spectrum

[2D array] Columns are the periodograms of successive segments.

### freqs

[1-D array] The frequencies corresponding to the rows in `spectrum`.

### t

[1-D array] The times corresponding to midpoints of segments (i.e., the columns in `spectrum`).

### im

[`AxesImage`] The image created by `imshow` containing the spectrogram.

## See also:

### `psd`

Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

### `magnitude_spectrum`

A single spectrum, similar to having a single segment when `mode` is 'magnitude'. Plots a line instead of a colormap.

### `angle_spectrum`

A single spectrum, similar to having a single segment when `mode` is 'angle'. Plots a line instead of a colormap.

### `phase_spectrum`

A single spectrum, similar to having a single segment when `mode` is 'phase'. Plots a line instead of a colormap.

## Notes

The parameters `detrend` and `scale_by_freq` do only apply when `mode` is set to 'psd'.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.specgram`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_specgram\_demo.py

## `matplotlib.axes.Axes.xcorr`

`Axes.xcorr(self, x, y, normed=True, detrend=<function detrend_none at 0x7f27ec1cf1f0>, usevlines=True, maxlags=10, *, data=None, **kwargs)`  
Plot the cross correlation between `x` and `y`.

The correlation with lag `k` is defined as  $\sum_n x[n+k] \cdot y^*[n]$ , where  $y^*$  is the complex conjugate of `y`.

### Parameters

#### `x, y`

[array-like of length `n`]

#### `detrend`

[callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to `x` and `y`. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

#### `normed`

[bool, default: True] If `True`, input vectors are normalised to unit length.

#### `usevlines`

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the `xcorr` value using `Axes.vlines`. Additionally, a horizontal line is plotted at `y=0` using `Axes.axhline`.

If `False`, markers are plotted at the `xcorr` values using `Axes.plot`.

#### `maxlags`

---

[int, default: 10] Number of lags to show. If None, will return all  $2 * \text{len}(x) - 1$  lags.

## Returns

### lags

[array (length  $2 * \text{maxlags} + 1$ )] The lag vector.

### c

[array (length  $2 * \text{maxlags} + 1$ )] The auto correlation vector.

### line

[*LineCollection* or *Line2D*] *Artist* added to the Axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

### b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

## Other Parameters

### linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is False.

### marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is False.

### \*\*kwargs

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is True; otherwise they are passed to *Axes.plot*.

## Notes

The cross correlation is performed with `numpy.correlate` with mode = "full".

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string s, which is interpreted as `data[s]` (unless this raises an exception): x, y.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

### Examples using `matplotlib.axes.Axes.xcorr`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_xcorr\_acorr\_demo.py

## Statistics

<code>Axes.boxplot</code>	Make a box and whisker plot.
<code>Axes.violinplot</code>	Make a violin plot.
<code>Axes.violin</code>	Drawing function for violin plots.
<code>Axes.bxp</code>	Drawing function for box and whisker plots.

### `matplotlib.axes.Axes.boxplot`

`Axes.boxplot`(*self*, *x*, *notch=None*, *sym=None*, *vert=None*, *whis=None*, *positions=None*, *widths=None*, *patch\_artist=None*, *bootstrap=None*, *usermedians=None*, *conf\_intervals=None*, *meanline=None*, *showmeans=None*, *showcaps=None*, *showbox=None*, *showfliers=None*, *boxprops=None*, *labels=None*, *flierprops=None*, *medianprops=None*, *meanprops=None*, *capprops=None*, *whiskerprops=None*, *manage\_ticks=True*, *autorange=False*, *zorder=None*, \*, *data=None*)

Make a box and whisker plot.

Make a box and whisker plot for each column of *x* or each vector in sequence *x*. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

#### Parameters

##### `x`

[Array or a sequence of vectors.] The input data.

##### `notch`

[bool, default: False] Whether to draw a notched box plot (`True`), or a rectangular box plot (`False`). The notches represent the confidence interval (CI) around the median. The documentation for *bootstrap* describes how the locations of the notches are computed by default, but their locations may also be overridden by setting the *conf\_intervals* parameter.

**Note:** In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

##### `sym`

[str, optional] The default symbol for flier points. An empty string ("") hides the fliers. If `None`, then the fliers default to 'b+'. More control is provided by the `flierprops` parameter.

#### **vert**

[bool, default: `True`] If `True`, draws vertical boxes. If `False`, draw horizontal boxes.

#### **whis**

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above  $Q1 - whis * (Q3 - Q1)$ , and the upper whisker at the highest datum below  $Q3 + whis * (Q3 - Q1)$ , where  $Q1$  and  $Q3$  are the first and third quartiles. The default value of `whis` = 1.5 corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data.

In the edge case where  $Q1 == Q3$ , `whis` is automatically set to (0, 100) (cover the whole range of the data) if `autorange` is `True`.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

#### **bootstrap**

[int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If `bootstrap` is `None`, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, `bootstrap` specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

#### **usermedians**

[1D array-like, optional] A 1D array-like of length `len(x)`. Each entry that is not `None` forces the value of the median for the corresponding dataset. For entries that are `None`, the medians are computed by Matplotlib as normal.

#### **conf\_intervals**

[array-like, optional] A 2D array-like of shape `(len(x), 2)`. Each entry that is not `None` forces the location of the corresponding notch (which is only drawn if `notch` is `True`). For entries that are `None`, the notches are computed by the method specified by the other parameters (e.g., `bootstrap`).

#### **positions**

[array-like, optional] The positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where  $N$  is the number of boxes to be drawn.

**widths**

[float or array-like] The widths of the boxes. The default is 0.5, or  $0.15 * (\text{distance between extreme positions})$ , if that is smaller.

**patch\_artist**

[bool, default: False] If `False` produces boxes with the `Line2D` artist. Otherwise, boxes and drawn with `Patch` artists.

**labels**

[sequence, optional] Labels for each dataset (one per dataset).

**manage\_ticks**

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

**autorange**

[bool, default: False] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

**meanline**

[bool, default: False] If `True` (and `showmeans` is `True`), will try to render the mean as a line spanning the full width of the box according to `meanprops` (see below). Not recommended if `shownotches` is also True. Otherwise, means will be shown as points.

**zorder**

[float, default: `Line2D.zorder = 2`] The zorder of the boxplot.

**Returns****dict**

A dictionary mapping each component of the boxplot to a list of the `Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

## Other Parameters

### **showcaps**

[bool, default: True] Show the caps on the ends of whiskers.

### **showbox**

[bool, default: True] Show the central box.

### **showfliers**

[bool, default: True] Show the outliers beyond the caps.

### **showmeans**

[bool, default: False] Show the arithmetic means.

### **capprops**

[dict, default: None] The style of the caps.

### **boxprops**

[dict, default: None] The style of the box.

### **whiskerprops**

[dict, default: None] The style of the whiskers.

### **flierprops**

[dict, default: None] The style of the fliers.

### **medianprops**

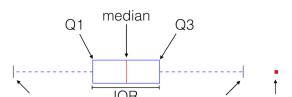

[dict, default: None] The style of the median.

### **meanprops**

[dict, default: None] The style of the mean.

## Notes

Box plots provide insight into distribution properties of the data. However, they can be challenging to interpret for the unfamiliar reader. The figure below illustrates the different visual features of a box plot.

**Q1:** Quartile 1, or median of the left data subset  
after dividing the original data set into 2 subsets via the median  
(25% of the data points fall below this threshold)

**Q3:** Quartile 3, median of the right data subset  
(75% of the data points fall below this threshold)

**IQR:** Interquartile-range,  $Q3 - Q1$

**Outliers:** Data points are considered to be outliers if  
 $\text{value} < Q1 - 1.5 \times \text{IQR}$  or  
 $\text{value} > Q3 + 1.5 \times \text{IQR}$

© 2016 Sebastian Raschka. This work is licensed under a Creative Commons Attribution 4.0 International License.

The whiskers mark the range of the non-outlier data. The most common definition of non-outlier is  $[Q1 - 1.5 \times IQR, Q3 + 1.5 \times IQR]$ , which is also the default in this function. Other whisker meanings can be applied via the `whis` parameter.

See [Box plot](#) on Wikipedia for further information.

Violin plots ([violinplot](#)) add even more detail about the statistical distribution by plotting the kernel density estimation (KDE) as an estimation of the probability density function.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

---

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

### Examples using `matplotlib.axes.Axes.boxplot`

- sphx\_glr\_gallery\_statistics\_boxplot\_color.py
- sphx\_glr\_gallery\_statistics\_boxplot\_demo.py
- sphx\_glr\_gallery\_pyplots\_boxplot\_demo\_pyplot.py

### `matplotlib.axes.Axes.violinplot`

```
Axes.violinplot(self, dataset, positions=None, vert=True, widths=0.5, showmeans=False,
                  showextrema=True, showmedians=False, quantiles=None, points=100,
                  bw_method=None, *, data=None)
```

Make a violin plot.

Make a violin plot for each column of `dataset` or each vector in sequence `dataset`. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

#### Parameters

##### `dataset`

[Array or a sequence of vectors.] The input data.

##### `positions`

[array-like, default: [1, 2, ..., n]] The positions of the violins. The ticks and limits are automatically set to match the positions.

##### `vert`

[bool, default: True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.

**widths**

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

**showmeans**

[bool, default: False] If `True`, will toggle rendering of the means.

**showextrema**

[bool, default: True] If `True`, will toggle rendering of the extrema.

**showmedians**

[bool, default: False] If `True`, will toggle rendering of the medians.

**quantiles**

[array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.

**points**

[int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

**bw\_method**

[str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as its only parameter and return a scalar. If None (default), 'scott' is used.

**Returns****dict**

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- **bodies**: A list of the `PolyCollection` instances containing the filled area of each violin.
- **cmeans**: A `LineCollection` instance that marks the mean values of each of the violin's distribution.
- **cmins**: A `LineCollection` instance that marks the bottom of each violin's distribution.
- **cmaxes**: A `LineCollection` instance that marks the top of each violin's distribution.
- **cbars**: A `LineCollection` instance that marks the centers of each violin's distribution.

- `cmedians`: A `LineCollection` instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A `LineCollection` instance created to identify the quantile values of each of the violin's distribution.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `dataset`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.violinplot`

- `sphx_glr_gallery_statistics_customized_violin.py`

## `matplotlib.axes.Axes.violin`

`Axes.violin(self, vpstats, positions=None, vert=True, widths=0.5, showmeans=False, showextrema=True, showmedians=False)`  
Drawing function for violin plots.

Draw a violin plot for each column of `vpstats`. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and the quantiles values.

### Parameters

#### `vpstats`

[list of dicts] A list of dictionaries containing stats for each violin plot. Required keys are:

- `coords`: A list of scalars containing the coordinates that the violin's kernel density estimate were evaluated at.
- `vals`: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in `coords`.
- `mean`: The mean value for this violin's dataset.
- `median`: The median value for this violin's dataset.
- `min`: The minimum value for this violin's dataset.
- `max`: The maximum value for this violin's dataset.

Optional keys are:

- **quantiles**: A list of scalars containing the quantile values for this violin's dataset.

### positions

[array-like, default: [1, 2, ..., n]] The positions of the violins. The ticks and limits are automatically set to match the positions.

### vert

[bool, default: True.] If true, plots the violins vertically. Otherwise, plots the violins horizontally.

### widths

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

### showmeans

[bool, default: False] If true, will toggle rendering of the means.

### showextrema

[bool, default: True] If true, will toggle rendering of the extrema.

### showmedians

[bool, default: False] If true, will toggle rendering of the medians.

## Returns

### dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- **bodies**: A list of the *PolyCollection* instances containing the filled area of each violin.
- **cmeans**: A *LineCollection* instance that marks the mean values of each of the violin's distribution.
- **cmins**: A *LineCollection* instance that marks the bottom of each violin's distribution.
- **cmaxes**: A *LineCollection* instance that marks the top of each violin's distribution.
- **cbars**: A *LineCollection* instance that marks the centers of each violin's distribution.
- **cmedians**: A *LineCollection* instance that marks the median values of each of the violin's distribution.

- `cquantiles`: A `LineCollection` instance created to identify the quantiles values of each of the violin's distribution.

### Examples using `matplotlib.axes.Axes.violin`

#### `matplotlib.axes.Axes.bxp`

```
Axes.bxp(self, bxpstats, positions=None, widths=None, vert=True, patch_artist=False,
         shownotches=False, showmeans=False, showcaps=True, showbox=True,
         showfliers=True, boxprops=None, whiskerprops=None, flierprops=None, medianprops=None,
         capprops=None, meanprops=None, meanline=False, manage_ticks=True, zorder=None)
```

Drawing function for box and whisker plots.

Make a box and whisker plot for each column of  $x$  or each vector in sequence  $x$ . The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

#### Parameters

##### `bxpstats`

[list of dicts] A list of dictionaries containing stats for each boxplot. Required keys are:

- `med`: The median (scalar float).
- `q1`: The first quartile (25th percentile) (scalar float).
- `q3`: The third quartile (75th percentile) (scalar float).
- `whislo`: Lower bound of the lower whisker (scalar float).
- `whishi`: Upper bound of the upper whisker (scalar float).

Optional keys are:

- `mean`: The mean (scalar float). Needed if `showmeans=True`.
- `fliers`: Data beyond the whiskers (sequence of floats). Needed if `showfliers=True`.
- `cilo` & `cihi`: Lower and upper confidence intervals about the median. Needed if `shownotches=True`.
- `label`: Name of the dataset (string). If available, this will be used a tick label for the boxplot

##### `positions`

[array-like, default: [1, 2, ..., n]] The positions of the boxes. The ticks and limits are automatically set to match the positions.

**widths**

[array-like, default: None] Either a scalar or a vector and sets the width of each box. The default is  $0.15^*$  (distance between extreme positions), clipped to no less than 0.15 and no more than 0.5.

**vert**

[bool, default: True] If `True` (default), makes the boxes vertical. If `False`, makes horizontal boxes.

**patch\_artist**

[bool, default: False] If `False` produces boxes with the `Line2D` artist. If `True` produces boxes with the `Patch` artist.

**shownotches**

[bool, default: False] If `False` (default), produces a rectangular box plot. If `True`, will produce a notched box plot

**showmeans**

[bool, default: False] If `True`, will toggle on the rendering of the means

**showcaps**

[bool, default: True] If `True`, will toggle on the rendering of the caps

**showbox**

[bool, default: True] If `True`, will toggle on the rendering of the box

**showfliers**

[bool, default: True] If `True`, will toggle on the rendering of the fliers

**boxprops**

[dict or None (default)] If provided, will set the plotting style of the boxes

**whiskerprops**

[dict or None (default)] If provided, will set the plotting style of the whiskers

**capprops**

[dict or None (default)] If provided, will set the plotting style of the caps

**flierprops**

[dict or None (default)] If provided will set the plotting style of the fliers

**medianprops**

[dict or None (default)] If provided, will set the plotting style of the medians

**meanprops**

[dict or None (default)] If provided, will set the plotting style of the means

### meanline

[bool, default: False] If `True` (and `showmeans` is `True`), will try to render the mean as a line spanning the full width of the box according to `meanprops`. Not recommended if `shownotches` is also True. Otherwise, means will be shown as points.

### manage\_ticks

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

### zorder

[float, default: `Line2D.zorder = 2`] The zorder of the resulting boxplot.

## Returns

### dict

A dictionary mapping each component of the boxplot to a list of the `Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

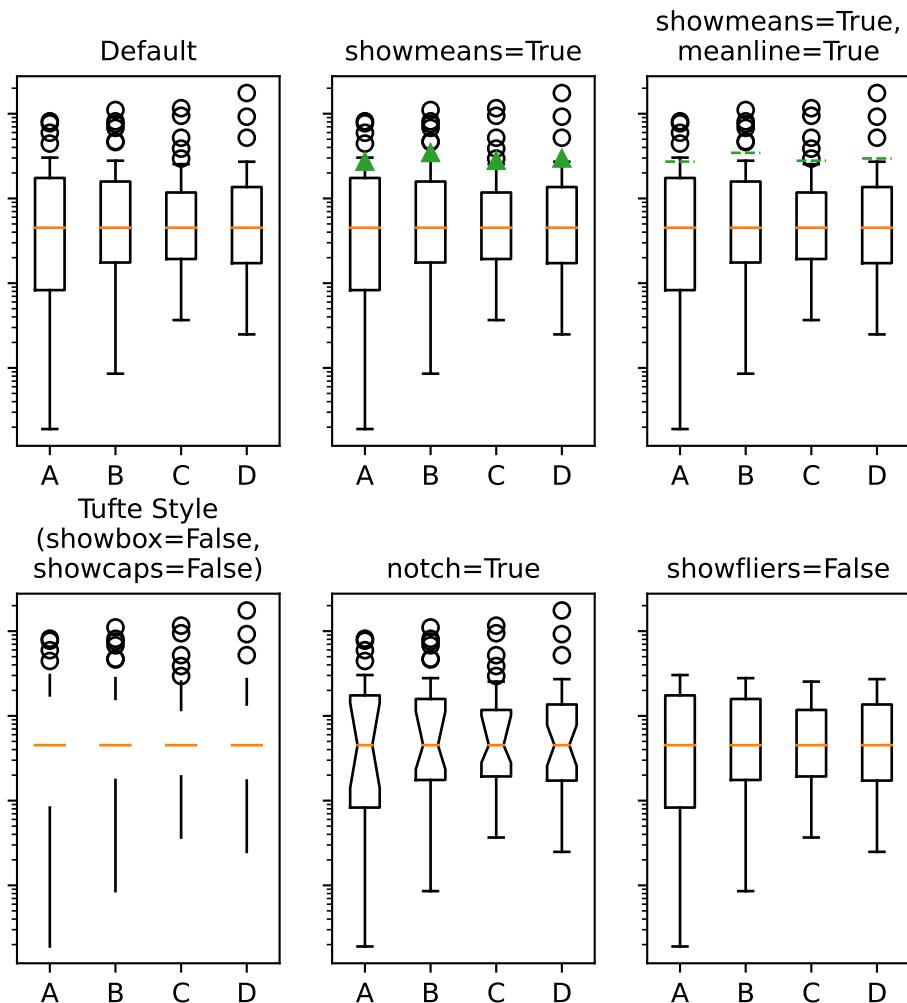

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

## Examples

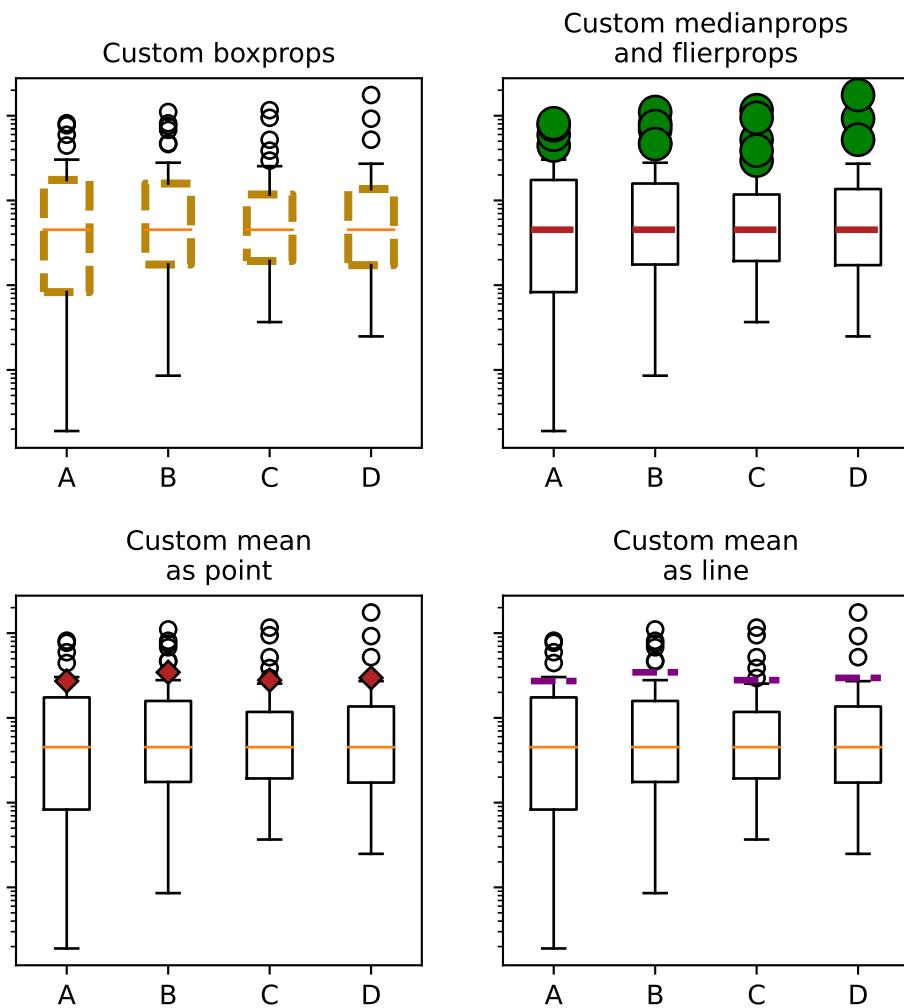

### Examples using `matplotlib.axes.Axes.bxp`

#### Binned

<code>Axes.hexbin</code>	Make a 2D hexagonal binning plot of points $x, y$ .
<code>Axes.hist</code>	Plot a histogram.
<code>Axes.hist2d</code>	Make a 2D histogram plot.
<code>Axes.stairs</code>	A stepwise constant function as a line with bounding edges or a filled plot.

I never said they'd be pretty

**matplotlib.axes.Axes.hexbin**

```
Axes.hexbin(self, x, y, C=None, gridsize=100, bins=None, xscale='linear', yscale='linear',
           extent=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None,
           linewidths=None, edgecolors='face', reduce_C_function=<function mean at
           0x7f27f8437700>, mincnt=None, marginals=False, *, data=None, **kwargs)
Make a 2D hexagonal binning plot of points x, y.
```

If *C* is *None*, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, *C* specifies values at the coordinate (x[i], y[i]). For each hexagon, these values are reduced using *reduce\_C\_function*.

**Parameters****x, y**

[array-like] The data positions. *x* and *y* must be of the same length.

**C**

[array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as *x* and *y*.

**gridsize**

[int or (int, int), default: 100] If a single int, the number of hexagons in the *x*-direction. The number of hexagons in the *y*-direction is chosen such that the hexagons are approximately regular.

Alternatively, if a tuple (*nx*, *ny*), the number of hexagons in the *x*-direction and the *y*-direction.

**bins**

['log' or int or sequence, default: None] Discretization of the hexagon values.

- If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.
- If 'log', use a logarithmic scale for the colormap. Internally,  $\log_{10}(i + 1)$  is used to determine the hexagon color. This is equivalent to *norm*=*LogNorm*().
- If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
- If a sequence of values, the values of the lower bound of the bins to be used.

**xscale**

{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

**yscale**

{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

**mincnt**

[int > 0, default: *None*] If not *None*, only display cells with more than *mincnt* number of points in the cell.

**marginals**

[bool, default: *False*] If *marginals* is *True*, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

**extent**

[float, default: *None*] The limits of the bins. The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

**Returns****PolyCollection**

A *PolyCollection* defining the hexagonal bins.

- *PolyCollection.get\_offsets* contains a Mx2 array containing the x, y positions of the M hexagon centers.
- *PolyCollection.get\_array* contains the values of the M hexagons.

If *marginals* is *True*, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes *hbar* and *vbar*.

**Other Parameters****cmap**

[str or *Colormap*, default: `rcParams["image.cmap"]`] (default: 'viridis') The Colormap instance or registered colormap name used to map the bin values to colors.

**norm**

[*Normalize*, optional] The Normalize instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax**

[float, default: *None*] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of the bins in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

**alpha**

[float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewidths**

[float, default: *None*] If *None*, defaults to 1.0.

**edgecolors**

[{'face', 'none', *None*} or color, default: 'face'] The color of the hexagon edges.  
Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- *None*: Draw outlines in the default color.
- An explicit color.

**reduce\_C\_function**

[callable, default: `numpy.mean`] The function to aggregate *C* within the bins. It is ignored if *C* is not given. This must have the signature:

```
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpyamax`: value taken from the largest point

**\*\*kwargs**

[*PolyCollection* properties] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	array-like or scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray or None
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clim</code>	(vmin: float, vmax: float)
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None

continu

Table 81 – continued from previous page

Property	Description
<code>cmap</code>	<code>Colormap</code> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<code>Figure</code>
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '..', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	(N, 2) or (2,) array-like
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>pickradius</code>	float

<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `C`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.hexbin`

- sphx\_glr\_gallery\_statistics\_hexbin\_demo.py

## `matplotlib.axes.Axes.hist`

`Axes.hist(self, x, bins=None, range=None, density=False, weights=None, cumulative=False, bottom=None, histtype='bar', align='mid', orientation='vertical', rwidth=None, log=False, color=None, label=None, stacked=False, *, data=None, **kwargs)`

Plot a histogram.

Compute and draw the histogram of *x*. The return value is a tuple (*n, bins, patches*) or ([*n*<sub>0</sub>, *n*<sub>1</sub>, ...], *bins*, [*patches*<sub>0</sub>, *patches*<sub>1</sub>, ...]) if the input contains multiple data. See the documentation of the *weights* parameter to draw a histogram of already-binned data.

Multiple data can be provided via *x* as a list of datasets of potentially different length ([*x*<sub>0</sub>, *x*<sub>1</sub>, ...]), or as a 2D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported.

The *bins*, *range*, *weights*, and *density* parameters behave as in `numpy.histogram`.

### Parameters

#### `x`

[(*n*,) array or sequence of (*n*,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

#### `bins`

[int or sequence or str, default: `rcParams["hist.bins"]`] (default: 10) If *bins* is an integer, it defines the number of equal-width bins in the range.

If *bins* is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, *bins* may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if *bins* is:

```
[1, 2, 3, 4]
```

then the first bin is [1, 2) (including 1, but excluding 2) and the second [2, 3). The last bin, however, is [3, 4], which *includes* 4.

If *bins* is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: 'auto', 'fd', 'doane', 'scott', 'stone', 'rice', 'sturges', or 'sqrt'.

#### `range`

[tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, *range* is (*x.min()*, *x.max()*). Range has no effect if *bins* is a sequence.

If *bins* is a sequence or *range* is specified, autoscaling is based on the specified bin range instead of the range of *x*.

### **density**

[bool, default: False] If `True`, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts *and the bin width* (`density = counts / (sum(counts) * np.diff(bins))`), so that the area under the histogram integrates to 1 (`np.sum(density * np.diff(bins)) == 1`).

If *stacked* is also `True`, the sum of the histograms is normalized to 1.

### **weights**

[(n,) array-like or `None`, default: `None`] An array of weights, of the same shape as *x*. Each value in *x* only contributes its associated weight towards the bin count (instead of 1). If *density* is `True`, the weights are normalized, so that the integral of the density over the range remains 1.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `numpy.histogram` (by treating each bin as a single point with a weight equal to its count)

```
counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)
```

(or you may alternatively use `bar()`).

### **cumulative**

[bool or -1, default: `False`] If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If *density* is also `True` then the histogram is normalized such that the last bin equals 1.

If *cumulative* is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if *density* is also `True`, then the histogram is normalized such that the first bin equals 1.

### **bottom**

[array-like, scalar, or `None`, default: `None`] Location of the bottom of each bin, ie. bins are drawn from `bottom` to `bottom + hist(x, bins)` If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of `bottom` must match the number of bins. If `None`, defaults to 0.

### **histtype**

[{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.
- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

**align**

[{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.

- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.
- 'right': bars are centered on the right bin edges.

**orientation**

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', `barh` will be used for bar-type histograms and the `bottom` kwarg will be the left edges.

**rwidth**

[float or None, default: None] The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width.

Ignored if `histtype` is 'step' or 'stepfilled'.

**log**

[bool, default: False] If `True`, the histogram axis will be set to a log scale.

**color**

[color or array-like of colors or `None`, default: `None`] Color or sequence of colors, one per dataset. Default (`None`) uses the standard line color sequence.

**label**

[str or `None`, default: `None`] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that `legend` will work as expected.

**stacked**

[bool, default: `False`] If `True`, multiple data are stacked on top of each other. If `False` multiple data are arranged side by side if `histtype` is 'bar' or on top of each other if `histtype` is 'step'

**Returns****n**

[array or list of arrays] The values of the histogram bins. See *density* and *weights* for a description of the possible semantics. If input *x* is an array, then this is an array of length *nbins*. If input is a sequence of arrays [data1, data2, ...], then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array *n* (or of its element arrays) will always be float even if no weighting or normalization is used.

**bins**

[array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

**patches**

[*BarContainer* or list of a single *Polygon* or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

**Other Parameters****\*\*kwargs**

*Patch* properties

**See also:*****hist2d***

2D histograms

**Notes**

For large numbers of bins (>1000), 'step' and 'stepfilled' can be significantly faster than 'bar' and 'barstacked'.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *weights*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

## `matplotlib.axes.Axes.hist2d`

`Axes.hist2d(self, x, y, bins=10, range=None, density=False, weights=None, cmin=None, cmax=None, *, data=None, **kwargs)`  
Make a 2D histogram plot.

### Parameters

#### x, y

[array-like, shape (n,)] Input values

#### bins

[None or int or [int, int] or array-like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions (`nx=ny=bins`).
- If [`int, int`], the number of bins in each dimension (`nx, ny = bins`).
- If array-like, the bin edges for the two dimensions (`x_edges=y_edges=bins`).
- If [`array, array`], the bin edges in each dimension (`x_edges, y_edges = bins`).

The default value is 10.

**range**

[array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters):  $[[x_{\min}, x_{\max}], [y_{\min}, y_{\max}]]$ . All values outside of this range will be considered outliers and not tallied in the histogram.

**density**

[bool, default: False] Normalize histogram. See the documentation for the *density* parameter of [\*hist\*](#) for more details.

**weights**

[array-like, shape (n, ), optional] An array of values  $w_i$  weighing each sample  $(x_i, y_i)$ .

**cmin, cmax**

[float, default: None] All bins that has count less than *cmin* or more than *cmax* will not be displayed (set to NaN before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return.

**Returns****h**

[2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

**xedges**

[1D array] The bin edges along the x axis.

**yedges**

[1D array] The bin edges along the y axis.

**image**

[*QuadMesh*]

**Other Parameters****cmap**

[Colormap or str, optional] A [\*colors.Colormap\*](#) instance. If not set, use rc settings.

**norm**

[Normalize, optional] A [\*colors.Normalize\*](#) instance is used to scale luminance data to  $[0, 1]$ . If not set, defaults to [\*colors.Normalize\(\)\*](#).

**vmin/vmax**

[None or scalar, optional] Arguments passed to the `Normalize` instance.

**alpha**

[0 <= scalar <= 1 or None, optional] The alpha blending value.

**\*\*kwargs**

Additional parameters are passed along to the `pcolormesh` method and `QuadMesh` constructor.

**See also:****`hist`**

1D histogram plotting

**Notes**

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a `colors.LogNorm` instance to the `norm` keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with `colors.PowerNorm`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `weights`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

**Examples using `matplotlib.axes.Axes.hist2d`**

- sphx\_glr\_gallery\_statistics\_hist.py
- sphx\_glr\_gallery\_scales\_power\_norm.py

**`matplotlib.axes.Axes.stairs`**

`Axes.stairs(self, values, edges=None, *, orientation='vertical', baseline=0, fill=False, data=None, **kwargs)`

A stepwise constant function as a line with bounding edges or a filled plot.

**Parameters**

### values

[array-like] The step heights.

### edges

[array-like] The edge positions, with `len(edges) == len(vals) + 1`, between which the curve takes on `vals` values.

### orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The direction of the steps. Vertical means that *values* are along the y-axis, and edges are along the x-axis.

### baseline

[float, array-like or None, default: 0] The bottom value of the bounding edges or when `fill=True`, position of lower edge. If `fill` is True or an array is passed to `baseline`, a closed path is drawn.

### fill

[bool, default: False] Whether the area under the step curve should be filled.

### Returns

#### StepPatch

`[matplotlib.patches.StepPatch]`

### Other Parameters

#### \*\*kwargs

`StepPatch` properties

### Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.stairs`

### Contours

<code>Axes.clabel</code>	Label a contour plot.
<code>Axes.contour</code>	Plot contour lines.
<code>Axes.contourf</code>	Plot filled contours.

### matplotlib.axes.Axes.clabel

`Axes.clabel(self, CS, levels=None, **kwargs)`

Label a contour plot.

Adds labels to line contours in given `ContourSet`.

#### Parameters

##### CS

[`ContourSet` instance] Line contours to label.

##### levels

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

##### \*\*kwargs

All other parameters are documented in `clabel`.

### Examples using `matplotlib.axes.Axes.clabel`

- sphx\_glr\_gallery\_mplot3d\_contour3d\_2.py
- sphx\_glr\_gallery\_mplot3d\_contourf3d.py

## matplotlib.axes.Axes.contour

Axes.**contour**(*self*, \**args*, *data=None*, \*\**kwargs*)

Plot contour lines.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

*contour* and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

### Parameters

#### X, Y

[array-like, optional] The coordinates of the values in *Z*.

*X* and *Y* must both be 2D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in *Z* and `len(Y) == N` is the number of rows in *Z*.

If not given, they are assumed to be integer indices, i.e. `X = range(M), Y = range(N)`.

#### Z

[(M, N) array-like] The height values over which the contour is drawn.

#### levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use `MaxNLocator`, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

### Returns

`QuadContourSet`

### Other Parameters

#### corner\_mask

[bool, default: `rcParams["contour.corner_mask"]`] (default: `True`)  
Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

**colors**

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. '`red`' instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: '`viridis`') A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm**

[`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax**

[float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

**origin**

[{`None`, 'upper', 'lower', 'image'}, default: `None`] Determines the orientation and exact position of Z by specifying the position of `Z[0, 0]`. This is only relevant, if `X, Y` are not given.

- `None`: `Z[0, 0]` is at  $X=0, Y=0$  in the lower left corner.
- 'lower': `Z[0, 0]` is at  $X=0.5, Y=0.5$  in the lower left corner.
- 'upper': `Z[0, 0]` is at  $X=N+0.5, Y=0.5$  in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: '`upper`').

**extent**

[(`x0, x1, y0, y1`), optional] If `origin` is not `None`, then `extent` is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of `Z[0, 0]` is

the center of the pixel, not a corner. If *origin* is *None*, then  $(x0, y0)$  is the position of  $Z[0, 0]$ , and  $(x1, y1)$  is the position of  $Z[-1, -1]$ .

This argument is ignored if *X* and *Y* are specified in the call to `contour`.

### locator

[`ticker.Locator` subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to `MaxNLocator`.

### extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the `Colormap`. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_over` and `Colormap.set_under`.

---

**Note:** An existing `QuadContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

---

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

### xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

### antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: *True*).

**nchunk**

[int  $\geq 0$ , optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

**linewidths**

[float or array-like, default: `rcParams["contour.linewidth"]`] (default: None) *Only applies to contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

**linestyles**

[`{None, 'solid', 'dashed', 'dashdot', 'dotted'}`, optional] *Only applies to contour*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches**

[list[str], optional] *Only applies to contourf*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

**Notes**

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.
2. `contourf` fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

<code>z1 &lt; Z &lt;= z2</code>
---------------------------------

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

### Examples using `matplotlib.axes.Axes.contour`

### `matplotlib.axes.Axes.contourf`

`Axes.contourf(self, *args, data=None, **kwargs)`

Plot filled contours.

Call signature:

```
contourf([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

#### Parameters

##### `X, Y`

[array-like, optional] The coordinates of the values in `Z`.

`X` and `Y` must both be 2D with the same shape as `Z` (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in `Z` and `len(Y) == N` is the number of rows in `Z`.

If not given, they are assumed to be integer indices, i.e. `X = range(M), Y = range(N)`.

##### `Z`

[(M, N) array-like] The height values over which the contour is drawn.

**levels**

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int  $n$ , use `MaxNLocator`, which tries to automatically choose no more than  $n+1$  "nice" contour levels between  $vmin$  and  $vmax$ .

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

`QuadContourSet`

**Other Parameters****corner\_mask**

[bool, default: `rcParams["contour.corner_mask"]`] (default: `True`)  
Enable/disable corner masking, which only has an effect if  $Z$  is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

**colors**

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. '`red`' instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: '`viridis`') A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm**

[[Normalize](#), optional] If a colormap is used, the [Normalize](#) instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax**

[float, optional] If not *None*, either or both of these values will be supplied to the [Normalize](#) instance, overriding the default color scaling based on *levels*.

**origin**

[{'None', 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- *None*: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- 'lower': Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: 'upper').

**extent**

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in [imshow](#): it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (x0, y0) is the position of Z[0, 0], and (x1, y1) is the position of Z[-1, -1].

This argument is ignored if X and Y are specified in the call to contour.

**locator**

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to [MaxNLocator](#).

**extend**

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the [Colormap](#). Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

---

**Note:** An existing [QuadContourSet](#) does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be

---

left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

---

**Example:**

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                   colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

### xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

### antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is `True`. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: `True`).

### nchunk

[int  $\geq 0$ , optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of `nchunk` by `nchunk` quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the `antialiased` flag and value of `alpha`.

### linewidths

[float or array-like, default: `rcParams["contour.linewidth"]` (default: `None`)] *Only applies to contour.*

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If `None`, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

### linestyles

[`{None, 'solid', 'dashed', 'dashdot', 'dotted'}`, optional] *Only applies to contour.*

If `linestyles` is `None`, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

`linestyles` can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

### **hatches**

[list[str], optional] *Only applies to* `contourf`.

A list of cross hatch patterns to use on the filled areas. If `None`, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

### **Notes**

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.
2. `contourf` fills intervals that are closed at the top; that is, for boundaries  $z1$  and  $z2$ , the filled region is:

```
 $z1 < z \leq z2$ 
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

## 2D arrays

<code>Axes.imshow</code>	Display data as an image, i.e., on a 2D regular raster.
<code>Axes.matshow</code>	Plot the values of a 2D matrix or array as color-coded image.
<code>Axes.pcolor</code>	Create a pseudocolor plot with a non-regular rectangular grid.
<code>Axes.pcolorfast</code>	Create a pseudocolor plot with a non-regular rectangular grid.
<code>Axes.pcolormesh</code>	Create a pseudocolor plot with a non-regular rectangular grid.
<code>Axes.spy</code>	Plot the sparsity pattern of a 2D array.

## matplotlib.axes.Axes.imshow

```
Axes.imshow(self, X, cmap=None, norm=None, aspect=None, interpolation=None, alpha=None,
           vmin=None, vmax=None, origin=None, extent=None, *, filternorm=True, filter-
rad=4.0, resample=None, url=None, data=None, **kwargs)
```

Display data as an image, i.e., on a 2D regular raster.

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image set up the colormapping using the parameters `cmap='gray'`, `vmin=0`, `vmax=255`.

The number of pixels used to render an image is set by the Axes size and the `dpi` of the figure. This can lead to aliasing artifacts when the image is resampled because the displayed image size will usually not match the size of `X` (see /gallery/images\_contours\_and\_fields/image\_antialiasing). The resampling can be controlled via the `interpolation` parameter and/or `rcParams["image.interpolation"]` (default: '`antialiased`').

### Parameters

#### X

[array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters `norm`, `cmap`, `vmin`, `vmax`.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

#### cmap

[str or *Colormap*, default: `rcParams["image.cmap"]`] (default: '`viridis`') The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data.

### norm

[*Normalize*, optional] The *Normalize* instance used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

### aspect

[{'equal', 'auto'} or float, default: `rcParams["image.aspect"]`] (default: '`equal`') The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using *extent*).
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.

### interpolation

[str, default: `rcParams["image.interpolation"]`] (default: '`antialiased`') The interpolation method used.

Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'.

If *interpolation* is 'none', then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to 'nearest'. Note that most SVG renderers perform interpolation at rendering and that the default interpolation method they implement may differ.

If *interpolation* is the default 'antialiased', then 'nearest' interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then 'hanning' interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See [/gallery/images\\_contours\\_and\\_fields/interpolation\\_methods](/gallery/images_contours_and_fields/interpolation_methods) for an overview of the supported interpolation methods, and [/gallery/images\\_contours\\_and\\_fields/image\\_antialiasing](/gallery/images_contours_and_fields/image_antialiasing) for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

**alpha**

[float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

**vmin, vmax**

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is deprecated to use *vmin/vmax* when *norm* is given. When using RGB(A) data, parameters *vmin/vmax* are ignored.

**origin**

[{'upper', 'lower'}, default: `rcParams["image.origin"]`] (default: 'upper') Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axis points upward for 'lower' but downward for 'upper'.

See the [origin and extent in imshow](#) tutorial for examples and a more detailed description.

**extent**

[floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For `origin == 'upper'` the default is `(-0.5, numcols-0.5, numrows-0.5, -0.5)`.
- For `origin == 'lower'` the default is `(-0.5, numcols-0.5, -0.5, numrows-0.5)`.

See the [origin and extent in imshow](#) tutorial for examples and a more detailed description.

**filternorm**

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad**

[float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

**resample**

[bool, default: `rcParams["image.resample"]` (default: True)] When *True*, use a full resampling method. When *False*, only resample when the output image is larger than the input image.

**url**

[str, optional] Set the url of the created `AxesImage`. See `Artist.set_url`.

**Returns**

`AxesImage`

**Other Parameters****\*\*kwargs**

[`Artist` properties] These parameters are passed on to the constructor of the `AxesImage` artist.

**See also:****`matshow`**

Plot a matrix or an array as an image.

**Notes**

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

`imshow` expects RGB images adopting the straight (unassociated) alpha representation.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

---

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

### `matplotlib.axes.Axes.matshow`

`Axes.matshow(self, Z, **kwargs)`

Plot the values of a 2D matrix or array as color-coded image.

The matrix will be shown the way it would be printed, with the first row at the top. Row and column numbering is zero-based.

#### Parameters

`Z`

`[(M, N) array-like]` The matrix to be displayed.

#### Returns

`AxesImage`

#### Other Parameters

`**kwargs`

`[imshow arguments]`

See also:

**`imshow`**

More general function to plot data on a 2D regular raster.

**Notes**

This is just a convenience function wrapping `imshow` to set useful defaults for displaying a matrix. In particular:

- Set `origin='upper'`.
- Set `interpolation='nearest'`.
- Set `aspect='equal'`.
- Ticks are placed to the left and above.
- Ticks are formatted to show integer indices.

**Examples using `matplotlib.axes.Axes.imshow`****`matplotlib.axes.Axes.pcolor`**

`Axes.pcolor(self, *args, shading=None, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)`

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y], C, **kwargs)
```

*X* and *Y* can be used to specify the corners of the quadrilaterals.

---

**Hint:** `pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster `pcolormesh` instead. See [Differences between `pcolor\(\)` and `pcolormesh\(\)`](#) for a discussion of the differences.

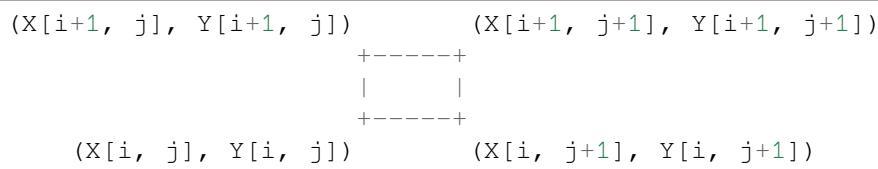

---

**Parameters****C**

[2D array-like] The color-mapped values.

**X, Y**

[array-like, optional] The coordinates of the corners of quadrilaterals of a `pcolormesh`:

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the [Notes](#) section below.

If `shading='flat'` the dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ , and the quadrilateral is colored due to the value at  $C[i, j]$ . If  $X$ ,  $Y$  and  $C$  have equal dimensions, a warning will be raised and the last row and column of  $C$  will be ignored.

If `shading='nearest'`, the dimensions of  $X$  and  $Y$  should be the same as those of  $C$  (if not, a `ValueError` will be raised). The color  $C[i, j]$  will be centered on  $(X[i, j], Y[i, j])$ .

If  $X$  and/or  $Y$  are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

### shading

[{'flat', 'nearest', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad  $(i, j)$ ,  $(i+1, j)$ ,  $(i, j+1)$ ,  $(i+1, j+1)$  is given by  $C[i, j]$ . The dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ ; if they are the same as  $C$ , then a deprecation warning is raised, and the last row and column of  $C$  are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of  $X$  and  $Y$  must be the same as  $C$ .
- 'auto': Choose 'flat' if dimensions of  $X$  and  $Y$  are one larger than  $C$ . Choose 'nearest' if dimensions are the same.

See `/gallery/images_contours_and_fields/pcolormesh_grids` for more description.

### cmap

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: 'viridis') A Colormap instance or registered colormap name. The colormap maps the  $C$  values to colors.

### norm

[`Normalize`, optional] The `Normalize` instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

### vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the `Normalize` instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

### `edgecolors`

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or ': No edge.
- *None*: `rcParams["patch.edgecolor"]` (default: 'black') will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: False) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

### `alpha`

[float, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

### `snap`

[bool, default: False] Whether to snap the mesh to pixel boundaries.

## Returns

`matplotlib.collections.Collection`

## Other Parameters

### `antialiaseds`

[bool, default: False] The default *antialiaseds* is False if the default *edgecolors*="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If *edgecolors* is not "none", then the default *antialiaseds* is taken from `rcParams["patch.antialiased"]` (default: True). Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

### `**kwargs`

Additionally, the following arguments are allowed. They are passed along to the `PolyCollection` constructor:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns

continu

Table 84 – continued from previous page

Property	Description
<code>alpha</code>	array-like or scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray or None
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clim</code>	(vmin: float, vmax: float)
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>cmap</code>	<code>Colormap</code> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<code>Figure</code>
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	(N, 2) or (2,) array-like
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

**See also:****`pcolormesh`**

for an explanation of the differences between `pcolor` and `pcolormesh`.

**`imshow`**

If  $X$  and  $Y$  are each equidistant, `imshow` can be a faster alternative.

## Notes

### Masked arrays

$X$ ,  $Y$  and  $C$  may be masked arrays. If either  $C[i, j]$ , or one of the vertices surrounding  $C[i, j]$  ( $X$  or  $Y$  at  $[i, j]$ ,  $[i+1, j]$ ,  $[i, j+1]$ ,  $[i+1, j+1]$ ) is masked, nothing is plotted.

### Grid orientation

The grid orientation follows the standard matrix convention: An array  $C$  with shape (nrows, ncolumns) is plotted with the column number as  $X$  and the row number as  $Y$ .

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string  $s$ , which is interpreted as  $\text{data}[s]$  (unless this raises an exception).

Objects passed as **data** must support item access ( $\text{data}[s]$ ) and membership test ( $s \in \text{data}$ ).

---

## Examples using `matplotlib.axes.Axes.pcolor`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_pcolor\_demo.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_margins.py

## matplotlib.axes.Axes.pcolorfast

`Axes.pcolorfast(self, *args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)`

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
ax.pcolorfast([X, Y], C, /, **kwargs)
```

This method is similar to `pcolor` and `pcolormesh`. It's designed to provide the fastest pcolor-type plotting with the Agg backend. To achieve this, it uses different algorithms internally depending on the complexity of the input grid (regular rectangular, non-regular rectangular or arbitrary quadrilateral).

**Warning:** This method is experimental. Compared to `pcolor` or `pcolormesh` it has some limitations:

- It supports only flat shading (no outlines)
- It lacks support for log scaling of the axes.
- It does not have a have a pyplot wrapper.

## Parameters

**C**

[array-like] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The data is visualized using a colormap.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

This parameter can only be passed positionally.

**X, Y**

[tuple or array-like, default: (0, N), (0, M)] X and Y are used to specify the coordinates of the quadrilaterals. There are different ways to do this:

- Use tuples X=(xmin, xmax) and Y=(ymin, ymax) to define a *uniform rectangular grid*.

The tuples define the outer edges of the grid. All individual quadrilaterals will be of the same size. This is the fastest version.

- Use 1D arrays X, Y to specify a *non-uniform rectangular grid*.

In this case X and Y have to be monotonic 1D arrays of length  $N+1$  and  $M+1$ , specifying the x and y boundaries of the cells.

The speed is intermediate. Note: The grid is checked, and if found to be uniform the fast version is used.

- Use 2D arrays X, Y if you need an *arbitrary quadrilateral grid* (i.e. if the quadrilaterals are not rectangular).

In this case X and Y are 2D arrays with shape (M + 1, N + 1), specifying the x and y coordinates of the corners of the colored quadrilaterals.

This is the most general, but the slowest to render. It may produce faster and more compact output using ps, pdf, and svg backends, however.

These arguments can only be passed positionally.

**cmap**

[str or Colormap, default: rcParams["image.cmap"] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps the C values to colors.

**norm**

[Normalize, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax**

---

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the `Normalize` instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

### alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

### snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

## Returns

`AxesImage` or `PcolorImage` or `QuadMesh`

The return type depends on the type of grid:

- `AxesImage` for a regular rectangular grid.
- `PcolorImage` for a non-regular rectangular grid.
- `QuadMesh` for a non-rectangular grid.

## Other Parameters

### \*\*kwargs

Supported additional parameters depend on the type of grid. See return types of *image* for further description.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.pcolorfast`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_pcolor\_demo.py

## `matplotlib.axes.Axes.pcolormesh`

`Axes.pcolormesh(self, *args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, shading=None, antialiased=False, data=None, **kwargs)`  
Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolormesh([X, Y,] C, **kwargs)
```

*X* and *Y* can be used to specify the corners of the quadrilaterals.

---

**Hint:** `pcolormesh` is similar to `pcolor`. It is much faster and preferred in most cases. For a detailed discussion on the differences see [Differences between pcolor\(\) and pcolormesh\(\)](#).

---

### Parameters

#### C

[2D array-like] The color-mapped values.

#### X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])      (X[i+1, j+1], Y[i+1, j+1])
+----+
|      |
+----+
(X[i, j], Y[i, j])      (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the [Notes](#) section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at *C*[*i*, *j*]. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'` or `'gouraud'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a `ValueError` will be raised). For `'nearest'` the color *C*[*i*, *j*] is centered on (*X*[*i*, *j*], *Y*[*i*, *j*]). For `'gouraud'`, a smooth interpolation is carried out between the quadrilateral corners.

If  $X$  and/or  $Y$  are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

### cmap

[str or *Colormap*, default: `rcParams["image.cmap"]`] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps the  $C$  values to colors.

### norm

[*Normalize*, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

### vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of  $C$  in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

### edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or ':': No edge.
- *None*: `rcParams["patch.edgecolor"]` (default: 'black') will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: *False*) has to be *True* for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

### alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

### shading

[{'flat', 'nearest', 'gouraud', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad  $(i, j), (i+1, j), (i, j+1), (i+1, j+1)$  is given by  $C[i, j]$ . The dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ ; if they are the same as  $C$ , then a deprecation warning is raised, and the last row and column of  $C$  are dropped.

- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of  $X$  and  $Y$  must be the same as  $C$ .
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners ( $i', j'$ ) are given by  $C[i', j']$ . The color values of the area in between is interpolated from the corner values. The dimensions of  $X$  and  $Y$  must be the same as  $C$ . When Gouraud shading is used, `edgecolors` is ignored.
- 'auto': Choose 'flat' if dimensions of  $X$  and  $Y$  are one larger than  $C$ . Choose 'nearest' if dimensions are the same.

See [/gallery/images\\_contours\\_and\\_fields/pcolormesh\\_grids](#) for more description.

**snap**

[bool, default: False] Whether to snap the mesh to pixel boundaries.

**rasterized: bool, optional**

Rasterize the pcolormesh when drawing vector graphics. This can speed up rendering and produce smaller files for large data sets. See also [/gallery/misc/rasterization\\_demo](#).

**Returns**

`matplotlib.collections.QuadMesh`

**Other Parameters****\*\*kwargs**

Additionally, the following arguments are allowed. They are passed along to the `QuadMesh` constructor:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 4) uint8 array
<code>alpha</code>	array-like or scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray or None
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clim</code>	(vmin: float, vmax: float)
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>cmap</code>	<code>Colorormap</code> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'

continu

Table 85 – continued from previous page

Property	Description
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<code>Figure</code>
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '!', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	(N, 2) or (2,) array-like
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

See also:

`pcolor`

An alternative implementation with slightly different features. For a detailed discussion on the differences see [Differences between `pcolor\(\)` and `pcolormesh\(\)`](#).

`imshow`

If  $X$  and  $Y$  are each equidistant, `imshow` can be a faster alternative.

## Notes

### Masked arrays

$C$  may be a masked array. If  $C[i, j]$  is masked, the corresponding quadrilateral will be transparent. Masking of  $X$  and  $Y$  is not supported. Use `pcolor` if you need this functionality.

### Grid orientation

The grid orientation follows the standard matrix convention: An array  $C$  with shape (nrows, ncolumns) is plotted with the column number as  $X$  and the row number as  $Y$ .

### Differences between `pcolor()` and `pcolormesh()`

Both methods are used to create a pseudocolor plot of a 2D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While `pcolor` returns a `PolyCollection`, `pcolormesh` returns a `QuadMesh`. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both `pcolor` and `pcolormesh` support masked arrays for `C`. However, only `pcolor` supports masked arrays for `X` and `Y`. The reason lies in the internal handling of the masked values. `pcolor` leaves out the respective polygons from the PolyCollection. `pcolormesh` sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in `pcolor` is not drawn as the corresponding polygons do not exist in the PolyCollection.

Another difference is the support of Gouraud shading in `pcolormesh`, which is not available with `pcolor`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## `matplotlib.axes.Axes.spy`

```
Axes.spy(self, Z, precision=0, marker=None, markersize=None, aspect='equal', origin='upper',
       **kwargs)
```

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

### Image style

If `marker` and `markersize` are `None`, `imshow` is used. Any extra remaining keyword arguments are passed to this method.

### Marker style

If `Z` is a `scipy.sparse.spmatrix` or `marker` or `markersize` are `None`, a `Line2D` object will be returned with the value of `marker` determining the marker type, and any remaining keyword arguments passed to `plot`.

### Parameters

#### `Z`

[(M, N) array-like] The array to be plotted.

#### `precision`

[float or 'present', default: 0] If `precision` is 0, any non-zero value will be plotted. Otherwise, values of  $|Z| > \text{precision}$  will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

#### `aspect`

[{'equal', 'auto', None} or float, default: 'equal'] The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.
- `None`: Use `rcParams["image.aspect"]` (default: 'equal').

#### `origin`

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention 'upper' is typically used for matrices and images.

## Returns

`AxesImage` or `Line2D`

The return type depends on the plotting style (see above).

## Other Parameters

### \*\*kwargs

The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of `imshow`:

- `cmap`
- `alpha`
- `url`
- any `Artist` properties (passed on to the `AxesImage`)

For the marker style, you can pass any `Line2D` property except for `linestyle`:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float

continues on

Table 86 – continued from previous page

Property	Description
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

## Examples using `matplotlib.axes.Axes.spy`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_spy\_demos.py

## Unstructured triangles

<code>Axes.tripcolor</code>	Create a pseudocolor plot of an unstructured triangular grid.
<code>Axes.triplot</code>	Draw a unstructured triangular grid as lines and/or markers.
<code>Axes.tricontour</code>	Draw contour lines on an unstructured triangular grid.
<code>Axes.tricontourf</code>	Draw contour regions on an unstructured triangular grid.

## matplotlib.axes.Axes.tripcolor

```
Axes.tripcolor(ax, *args, alpha=1.0, norm=None, cmap=None, vmin=None, vmax=None,  
shading='flat', facecolors=None, **kwargs)
```

Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

```
tripcolor(triangulation, ...)
```

where triangulation is a [Triangulation](#) object, or

```
tripcolor(x, y, ...)  
tripcolor(x, y, triangles, ...)  
tripcolor(x, y, triangles=triangles, ...)  
tripcolor(x, y, mask=mask, ...)  
tripcolor(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See [Triangulation](#) for a explanation of these possibilities.

The next argument must be *C*, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg `facecolors=C` instead of just *C*.

*shading* may be 'flat' (the default) or 'gouraud'. If *shading* is 'flat' and *C* values are defined at points, the color values used for each triangle are from the mean *C* of the triangle's three points. If *shading* is 'gouraud' then color values must be defined at points.

The remaining kwargs are the same as for [pcolor](#).

## Examples using matplotlib.axes.Axes.tripcolor

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tripcolor\_demo.py

## matplotlib.axes.Axes.triplot

```
Axes.triplot(ax, *args, **kwargs)
```

Draw a unstructured triangular grid as lines and/or markers.

The triangulation to plot can be specified in one of two ways; either:

```
triplot(triangulation, ...)
```

where triangulation is a [Triangulation](#) object, or

```
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a `Triangulation` object will be created. See [Triangulation](#) for a explanation of these possibilities.

The remaining args and kwargs are the same as for [plot](#).

### Returns

#### lines

[\[Line2D\]](#) The drawn triangles edges.

#### markers

[\[Line2D\]](#) The drawn marker nodes.

## Examples using `matplotlib.axes.Axes.triplot`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tricontour\_smooth\_delaunay.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tricontour\_smooth\_user.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_trigradient\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_triplot\_demo.py
- sphx\_glr\_gallery\_event\_handling\_trifinder\_event\_demo.py

## matplotlib.axes.Axes.tricontour

`Axes.tricontour(ax, *args, **kwargs)`

Draw contour lines on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontour(triangulation, ...)
```

where `triangulation` is a `Triangulation` object, or

```
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontour(..., Z, levels)
```

contour up to *levels*+1 automatically chosen contour levels (*levels* intervals).

```
tricontour(..., Z, levels)
```

draw contour lines at the values specified in sequence *levels*, which must be in increasing order.

```
tricontour(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

## Parameters

### **triangulation**

[*Triangulation*, optional] The unstructured triangular grid.

If specified, then *x*, *y*, *triangles*, and *mask* are not accepted.

### **x, y**

[array-like, optional] The coordinates of the values in *Z*.

### **triangles**

[(ntri, 3) array-like of int, optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

### **mask**

[(ntri,) array-like of bool, optional] Which triangles are masked out.

### **Z**

[2D array-like] The height values over which the contour is drawn.

### **levels**

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n*+1 "nice" contour levels between *vmin* and *vmax*.

---

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

## Returns

`TriContourSet`

## Other Parameters

### colors

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour lines.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. '`'red'`' instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

### alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

### cmap

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: '`'viridis'`') A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

### norm

[`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

### vmin, vmax

[float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

### origin

[`{None, 'upper', 'lower', 'image'}`, default: `None`] Determines the orientation and exact position of Z by specifying the position of `Z[0, 0]`. This is only relevant, if `X, Y` are not given.

- `None`: `Z[0, 0]` is at  $X=0, Y=0$  in the lower left corner.
- '`lowerZ[0, 0]` is at  $X=0.5, Y=0.5$  in the lower left corner.

- 'upper':  $Z[0, 0]$  is at  $X=N+0.5$ ,  $Y=0.5$  in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: 'upper').

**extent**

$(x0, x1, y0, y1)$ , optional] If *origin* is not *None*, then *extent* is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of  $Z[0, 0]$  is the center of the pixel, not a corner. If *origin* is *None*, then  $(x0, y0)$  is the position of  $Z[0, 0]$ , and  $(x1, y1)$  is the position of  $Z[-1, -1]$ .

This argument is ignored if *X* and *Y* are specified in the call to `contour`.

**locator**

[`ticker.Locator` subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to `MaxNLocator`.

**extend**

`[{'neither', 'both', 'min', 'max'}, default: 'neither']` Determines the `tricontour`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the `Colormap`. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

---

**Note:** An existing `TriContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call to `ContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `TriContourSet` because it internally calls `ContourSet.changed()`.

---

**xunits, yunits**

[registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**antialiased**

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: *True*).

**linewidths**

[float or array-like, default: `rcParams["contour.linewidth"]`] (default: *None*) The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

### linestyles

[`{None, 'solid', 'dashed', 'dashdot', 'dotted'}`, optional] If `linestyles` is `None`, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

`linestyles` can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

## Examples using `matplotlib.axes.Axes.tricontour`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_irregulardatagrid.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tricontour\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tricontour\_smooth\_delaunay.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tricontour\_smooth\_user.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_trigradient\_demo.py
- sphx\_glr\_gallery\_mplot3d\_tricontour3d.py

## `matplotlib.axes.Axes.tricontourf`

`Axes.tricontourf(ax, *args, **kwargs)`

Draw contour regions on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontourf(triangulation, ...)
```

where `triangulation` is a `Triangulation` object, or

```
tricontourf(x, y, ...)
tricontourf(x, y, triangles, ...)
tricontourf(x, y, triangles=triangles, ...)
tricontourf(x, y, mask=mask, ...)
tricontourf(x, y, triangles, mask=mask, ...)
```

in which case a `Triangulation` object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontourf(..., z)
```

where  $Z$  is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontourf(..., z, levels)
```

contour up to  $levels+1$  automatically chosen contour levels ( $levels$  intervals).

```
tricontourf(..., z, levels)
```

draw contour regions at the values specified in sequence  $levels$ , which must be in increasing order.

```
tricontourf(z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

## Parameters

### triangulation

[*Triangulation*, optional] The unstructured triangular grid.

If specified, then  $x$ ,  $y$ ,  $triangles$ , and  $mask$  are not accepted.

### x, y

[array-like, optional] The coordinates of the values in  $Z$ .

### triangles

[(ntri, 3) array-like of int, optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

### mask

[(ntri,) array-like of bool, optional] Which triangles are masked out.

### z

[2D array-like] The height values over which the contour is drawn.

### levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int  $n$ , use *MaxNLocator*, which tries to automatically choose no more than  $n+1$  "nice" contour levels between  $vmin$  and  $vmax$ .

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

## Returns

***TriContourSet*****Other Parameters****colors**

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour regions.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. '`red`' instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: '`viridis`') A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm**

[`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax**

[float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

**origin**

[{`None`, 'upper', 'lower', 'image'}, default: `None`] Determines the orientation and exact position of Z by specifying the position of `Z[0, 0]`. This is only relevant, if `X, Y` are not given.

- `None`: `Z[0, 0]` is at  $X=0, Y=0$  in the lower left corner.
- 'lower': `Z[0, 0]` is at  $X=0.5, Y=0.5$  in the lower left corner.
- 'upper': `Z[0, 0]` is at  $X=N+0.5, Y=0.5$  in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: 'upper').

**extent**

[ $(x_0, x_1, y_0, y_1)$ , optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of  $Z[0, 0]$  is the center of the pixel, not a corner. If *origin* is *None*, then  $(x_0, y_0)$  is the position of  $Z[0, 0]$ , and  $(x_1, y_1)$  is the position of  $Z[-1, -1]$ .

This argument is ignored if *X* and *Y* are specified in the call to *contour*.

**locator**

[*ticker.Locator* subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

**extend**

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the *triicontourf*-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set\_under* and *Colormap.set\_over*.

---

**Note:** An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

**xunits, yunits**

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

**antialiased**

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: *True*).

**hatches**

[list[str], optional] A list of cross hatch patterns to use on the filled areas. If *None*, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

## Notes

`tricontourf` fills intervals that are closed at the top; that is, for boundaries  $z1$  and  $z2$ , the filled region is:

```
z1 < z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

## Examples using `matplotlib.axes.Axes.tricontourf`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_irregulardatagrid.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tricontour\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_tricontour\_smooth\_user.py
- sphx\_glr\_gallery\_mplot3d\_tricontourf3d.py

## Text and annotations

<code>Axes.annotate</code>	Annotate the point $xy$ with text $text$ .
<code>Axes.text</code>	Add text to the Axes.
<code>Axes.table</code>	Add a table to an <code>Axes</code> .
<code>Axes.arrow</code>	Add an arrow to the Axes.
<code>Axes.inset_axes</code>	Add a child inset Axes to this existing Axes.
<code>Axes.indicate_inset</code>	Add an inset indicator to the Axes.
<code>Axes.indicate_inset_zoom</code>	Add an inset indicator rectangle to the Axes based on the axis limits for an <code>inset_ax</code> and draw connectors between <code>inset_ax</code> and the rectangle.
<code>Axes.secondary_xaxis</code>	Add a second x-axis to this Axes.
<code>Axes.secondary_yaxis</code>	Add a second y-axis to this Axes.

## `matplotlib.axes.Axes.annotate`

`Axes.annotate(self, text, xy, *args, **kwargs)`

Annotate the point  $xy$  with text  $text$ .

In the simplest form, the text is placed at  $xy$ .

Optionally, the text can be displayed in another position  $xytext$ . An arrow pointing from the text to the annotated point  $xy$  can then be added by defining `arrowprops`.

### Parameters

`text`

[str] The text of the annotation.

#### xy

[(float, float)] The point  $(x, y)$  to annotate. The coordinate system is determined by *xycoords*.

#### xytext

[(float, float), default: *xy*] The position  $(x, y)$  to place the text at. The coordinate system is determined by *textcoords*.

#### xycoords

[str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'subfigure points'	Points from the lower left of the subfigure
'subfigure pixels'	Pixels from the lower left of the subfigure
'subfigure fraction'	Fraction of subfigure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	$(\theta, r)$ if not native 'data' coordinates

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g.  $(0, 0)$  would be the lower left corner of the bounding box and  $(0.5, 1)$  would be the center top of the bounding box.
- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where *renderer* is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple (*xcoords*, *ycoords*) specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See [Advanced Annotations](#) for more details.

### textcoords

[str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the <i>xy</i> value
'offset pixels'	Offset (in pixels) from the <i>xy</i> value

### arrowprops

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*. Note that the edge of the arrow pointing to *xytext* will be centered on the text itself and may not point directly to the coordinates given in *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to <i>matplotlib.patches.FancyArrowPatch</i>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

Name	Attrs
'-'	None
'->'	head_length=0.4,head_width=0.2
'-[' '	widthB=1.0,lengthB=0.2,angleB=None
' - '	widthA=1.0,widthB=1.0
'- >'	head_length=0.4,head_width=0.2
'<-'	head_length=0.4,head_width=0.2
'<->'	head_length=0.4,head_width=0.2
'< -'	head_length=0.4,head_width=0.2
'< - >'	head_length=0.4,head_width=0.2
'fancy'	head_length=0.4,head_width=0.4,tail_width=0.4
'simple'	head_length=0.5,head_width=0.5,tail_width=0.2
'wedge'	tail_width=0.3,shrink_factor=0.5

Valid keys for `FancyArrowPatch` are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for <code>matplotlib.patches.PathPatch</code>

Defaults to None, i.e. no arrow is drawn.

### `annotation_clip`

[bool or None, default: None] Whether to draw the annotation when the annotation point `xy` is outside the axes area.

- If `True`, the annotation will only be drawn when `xy` is within the axes.
- If `False`, the annotation will always be drawn.
- If `None`, the annotation will only be drawn when `xy` is within the axes and `xycoords` is 'data'.

### `**kwargs`

Additional kwargs are passed to `Text`.

### Returns

#### `Annotation`

### matplotlib.axes.Axes.text

Axes.**text**(*self*, *x*, *y*, *s*, *fontdict=None*, *\*\*kwargs*)

Add text to the Axes.

Add the text *s* to the Axes at location *x*, *y* in data coordinates.

#### Parameters

**x, y**

[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

**s**

[str] The text.

#### fontdict

[dict, default: None] A dictionary to override the default text properties. If *fontdict* is None, the defaults are determined by *rcParams*.

#### Returns

**Text**

The created *Text* instance.

#### Other Parameters

**\*\*kwargs**

[*Text* properties.] Other miscellaneous text parameters.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 4) uint8 array.

Table 89 – continued from pre

Property	Description
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <code>patches.FancyBboxPatch</code>
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code> or <code>family</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code> or <code>font</code> or <code>font_properties</code>	<code>font_manager.FontProperties</code> or str or <code>pathlib.Path</code>
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'normal', 'semi-condensed', 'semi-expanded', 'expanded'}
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'bold', 'black'}
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>math_fontfamily</code>	str
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>text</code>	object
<code>transform</code>	<code>Transform</code>
<code>transform_rotates_text</code>	bool
<code>url</code>	str
<code>usetex</code>	bool or None
<code>verticalalignment</code> or <code>va</code>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<code>visible</code>	bool
<code>wrap</code>	bool
<code>x</code>	float
<code>y</code>	float
<code>zorder</code>	float

## Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the Axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...       verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

## **matplotlib.axes.Axes.table**

```
Axes.table(ax, cellText=None, cellColours=None, cellLoc='right', colWidths=None, rowLabels=None, rowColours=None, rowLoc='left', colLabels=None, colColours=None, colLoc='center', loc='bottom', bbox=None, edges='closed', **kwargs)
```

Add a table to an [Axes](#).

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the [Table](#) class and add it to the axes with *Axes.add\_table*.

### **Parameters**

#### **cellText**

[2D list of str, optional] The texts to place into the table cells.

*Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

#### **cellColours**

[2D list of colors, optional] The background colors of the cells.

#### **cellLoc**

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

#### **colWidths**

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of  $1 / ncols$ .

#### **rowLabels**

[list of str, optional] The text of the row header cells.

#### **rowColours**

[list of colors, optional] The colors of the row header cells.

#### **rowLoc**

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

#### **colLabels**

[list of str, optional] The text of the column header cells.

#### **colColours**

[list of colors, optional] The colors of the column header cells.

**colLoc**

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

**loc**

[str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

**bbox**

[*Bbox*, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

**edges**

[substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}] The cell edges to be drawn with a line. See also *visible\_edges*.

**Returns*****Table***

The created table.

**Other Parameters****\*\*kwargs**

*Table* properties.

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>figure</code>	<code>Figure</code>
<code>fontsize</code>	float
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>path_effect</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

## Examples using `matplotlib.axes.Axes.table`

### `matplotlib.axes.Axes.arrow`

`Axes.arrow(self, x, y, dx, dy, **kwargs)`

Add an arrow to the Axes.

This draws an arrow from  $(x, y)$  to  $(x+dx, y+dy)$ .

#### Parameters

**x, y**

[float] The x and y coordinates of the arrow base.

**dx, dy**

[float] The length of the arrow along x and y direction.

**width**

[float, default: 0.001] Width of full arrow tail.

**length\_includes\_head**

[bool, default: False] True if head is to be counted in calculating the length.

**head\_width**

[float or None, default: 3\*width] Total width of the full arrow head.

**head\_length**

[float or None, default: 1.5\*head\_width] Length of arrow head.

**shape**

[{'full', 'left', 'right'}, default: 'full'] Draw the left-half, right-half, or full arrow.

**overhang**

[float, default: 0] Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head\_starts\_at\_zero**

[bool, default: False] If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**\*\*kwargs**

*Patch* properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'

<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

## Returns

### `FancyArrow`

The created `FancyArrow` object.

## Notes

The resulting arrow is affected by the Axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use `annotate()` for example:

```
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...                 arrowprops=dict(arrowstyle="->"))
```

## Examples using `matplotlib.axes.Axes.arrow`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_arrow\_simple\_demo.py

## `matplotlib.axes.Axes.inset_axes`

`Axes.inset_axes(self, bounds, *, transform=None, zorder=5, **kwargs)`

Add a child inset Axes to this existing Axes.

### Parameters

#### `bounds`

`[[x0, y0, width, height]]` Lower-left corner of inset Axes, and its width and height.

#### `transform`

`[Transform]` Defaults to `ax.transAxes`, i.e. the units of `rect` are in Axes-relative coordinates.

**zorder**

[number] Defaults to 5 (same as `Axes.legend`). Adjust higher or lower to change whether it is above or below data plotted on the parent Axes.

**\*\*kwargs**

Other keyword arguments are passed on to the child `Axes`.

**Returns****ax**

The created `Axes` instance.

**Warning:** This method is experimental as of 3.0, and the API may change.

**Examples**

This example makes two inset Axes, the first is in Axes-relative coordinates, and the second in data-coordinates:

```
fig, ax = plt.subplots()
ax.plot(range(10))
axin1 = ax.inset_axes([0.8, 0.1, 0.15, 0.15])
axin2 = ax.inset_axes(
    [5, 7, 2.3, 2.3], transform=ax.transData)
```

**Examples using `matplotlib.axes.Axes.inset_axes`**

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_colorbar\_placement.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_zoom\_inset\_axes.py

**matplotlib.axes.Axes.indicate\_inset**

`Axes.indicate_inset(self, bounds, inset_ax=None, *, transform=None, facecolor='none', edgecolor='0.5', alpha=0.5, zorder=4.99, **kwargs)`

Add an inset indicator to the Axes. This is a rectangle on the plot at the position indicated by `bounds` that optionally has lines that connect the rectangle to an inset Axes (`Axes.inset_axes`).

**Parameters****bounds**

[[x0, y0, width, height]] Lower-left corner of rectangle to be marked, and its width and height.

**inset\_ax**

[[Axes](#)] An optional inset Axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset Axes on corners chosen so as to not overlap with the indicator box.

**transform**

[[Transform](#)] Transform for the rectangle coordinates. Defaults to `ax.transAxes`, i.e. the units of `rect` are in Axes-relative coordinates.

**facecolor**

[color, default: 'none'] Facecolor of the rectangle.

**edgecolor**

[color, default: '0.5'] Color of the rectangle and color of the connecting lines.

**alpha**

[float, default: 0.5] Transparency of the rectangle and connector lines.

**zorder**

[float, default: 4.99] Drawing order of the rectangle and connector lines. The default, 4.99, is just below the default level of inset Axes.

**\*\*kwargs**

Other keyword arguments are passed on to the [Rectangle](#) patch:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<a href="#">CapStyle</a> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<a href="#">Bbox</a>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<a href="#">Figure</a>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<a href="#">JoinStyle</a> or {'miter', 'round', 'bevel'}
<code>label</code>	object

continues on next page

Table 91 – continued from previous page

Property	Description
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**Returns****rectangle\_patch**

[`patches.Rectangle`] The indicator frame.

**connector\_lines**

[4-tuple of `patches.ConnectionPatch`] The four connector lines connecting to (lower\_left, upper\_left, lower\_right, upper\_right) corners of `inset_ax`. Two lines are set with visibility to `False`, but the user can set the visibility to True if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.

**Examples using `matplotlib.axes.Axes.indicate_inset`****`matplotlib.axes.Axes.indicate_inset_zoom`**

`Axes.indicate_inset_zoom(self, inset_ax, **kwargs)`

Add an inset indicator rectangle to the Axes based on the axis limits for an `inset_ax` and draw connectors between `inset_ax` and the rectangle.

**Parameters****`inset_ax`**

[`Axes`] Inset Axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset Axes on corners chosen so as to not overlap with the indicator box.

**`**kwargs`**

Other keyword arguments are passed on to `Axes.indicate_inset`

### Returns

#### `rectangle_patch`

[`patches.Rectangle`] Rectangle artist.

#### `connector_lines`

[4-tuple of `patches.ConnectionPatch`] Each of four connector lines coming from the rectangle drawn on this axis, in the order lower left, upper left, lower right, upper right. Two are set with visibility to `False`, but the user can set the visibility to `True` if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.

## Examples using `matplotlib.axes.Axes.indicate_inset_zoom`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_zoom\_inset\_axes.py

## `matplotlib.axes.Axes.secondary_xaxis`

`Axes.secondary_xaxis(self, location, *, functions=None, **kwargs)`

Add a second x-axis to this Axes.

For example if we want to have a second scale for the data plotted on the xaxis.

### Parameters

#### `location`

[{'top', 'bottom', 'left', 'right'} or float] The position to put the secondary axis. Strings can be 'top' or 'bottom' for orientation='x' and 'right' or 'left' for orientation='y'. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

#### `functions`

[2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2.

The user can also directly supply a subclass of `transforms.Transform` so long as it has an inverse.

See `/gallery/subplots_axes_and_figures/secondary_axis` for examples of making these conversions.

## Returns

`ax`

[`axes._secondary_axes.SecondaryAxis`]

## Other Parameters

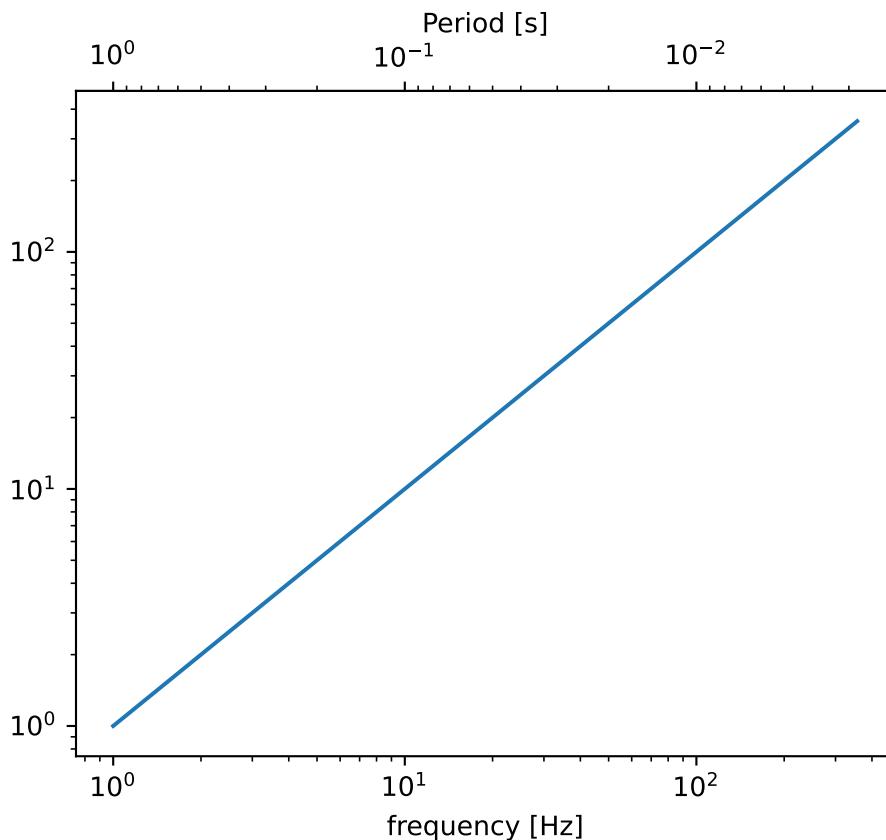

`**kwargs`

[`Axes` properties.] Other miscellaneous axes parameters.

**Warning:** This method is experimental as of 3.1, and the API may change.

## Examples

The main axis shows frequency, and the secondary axis shows period.

### Examples using `matplotlib.axes.Axes.secondary_xaxis`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_secondary\_axis.py

### `matplotlib.axes.Axes.secondary_yaxis`

`Axes.secondary_yaxis(self, location, *, functions=None, **kwargs)`

Add a second y-axis to this Axes.

For example if we want to have a second scale for the data plotted on the yaxis.

#### Parameters

##### `location`

[{'top', 'bottom', 'left', 'right'} or float] The position to put the secondary axis. Strings can be 'top' or 'bottom' for orientation='x' and 'right' or 'left' for orientation='y'. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

##### `functions`

[2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2.

The user can also directly supply a subclass of `transforms.Transform` so long as it has an inverse.

See `/gallery/subplots_axes_and_figures/secondary_axis` for examples of making these conversions.

#### Returns

##### `ax`

[`axes._secondary_axes.SecondaryAxis`]

#### Other Parameters

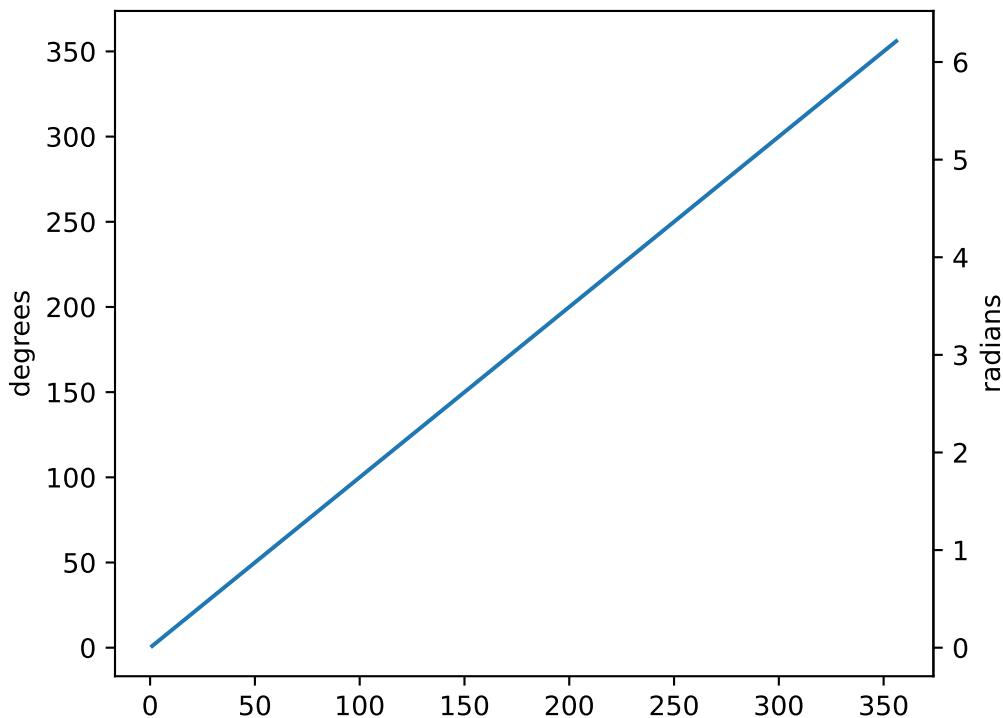

##### `**kwargs`

[`Axes` properties.] Other miscellaneous axes parameters.

**Warning:** This method is experimental as of 3.1, and the API may change.

## Examples

Add a secondary Axes that converts from radians to degrees

## Examples using `matplotlib.axes.Axes.secondary_yaxis`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`

## Vector fields

---

<code>Axes.barbs</code>	Plot a 2D field of barbs.
<code>Axes.quiver</code>	Plot a 2D field of arrows.
<code>Axes.quiverkey</code>	Add a key to a quiver plot.
<code>Axes.streamplot</code>	Draw streamlines of a vector flow.

---

**matplotlib.axes.Axes.barbs**

```
Axes.barbs(self, *args, data=None, **kw)
```

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where  $X, Y$  define the barb locations,  $U, V$  define the barb directions, and  $C$  optionally sets the color.

All arguments may be 1D or 2D.  $U, V, C$  may be masked arrays, but masked  $X, Y$  are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as shown schematically below:

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also [https://en.wikipedia.org/wiki/Wind\\_barb](https://en.wikipedia.org/wiki/Wind_barb).

**Parameters****X, Y**

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of  $U$  and  $V$ .

If  $X$  and  $Y$  are 1D but  $U, V$  are 2D,  $X, Y$  are expanded to 2D using  $X, Y = np.meshgrid(X, Y)$ . In this case  $\text{len}(X)$  and  $\text{len}(Y)$  must match the column and row dimensions of  $U$  and  $V$ .

**U, V**

[1D or 2D array-like] The x and y components of the barb shaft.

**C**

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

### length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

### pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

### barbcolor

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override *facecolor*.

### flagcolor

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override *facecolor*. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

### sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

### fill\_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

### rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb\_increments**

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

**flip\_barb**

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as  $U$  and  $V$ .

**Returns****barbs**

[*Barbs*]

**Other Parameters****\*\*kwargs**

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3), bool array of the same type
<i>alpha</i>	array-like or scalar or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray or None
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.barbs`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_barb\_demo.py

## `matplotlib.axes.Axes.quiver`

`Axes.quiver(self, *args, data=None, **kw)`

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

$X, Y$  define the arrow locations,  $U, V$  define the arrow directions, and  $C$  optionally sets the color.

### Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the `scale` and `scale_units` parameters.

### Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make `headaxislength` the same as `headlength`. To make the arrow more pointed, reduce `headwidth` or increase `headlength` and `headaxislength`. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave `minshaft` alone.

### Arrow outline

`linewidths` and `edgecolors` can be used to customize the arrow outlines.

### Parameters

#### `X, Y`

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of  $U$  and  $V$ .

If  $X$  and  $Y$  are 1D but  $U, V$  are 2D,  $X, Y$  are expanded to 2D using  $X, Y = np.meshgrid(X, Y)$ . In this case `len(X)` and `len(Y)` must match the column and row dimensions of  $U$  and  $V$ .

#### `U, V`

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations.  $U$  and  $V$  may be masked. Only locations unmasked in  $U, V$ , and  $C$  will be drawn.

#### `C`

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

### units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy':  $X, Y$  or  $\sqrt{X^2 + Y^2}$  in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width' or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

### angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if  $U == V$  the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on  $X, Y$  data coordinates.

- 'xy': Arrows point from  $(x, y)$  to  $(x+u, y+v)$ . Use this for plotting a gradient field, for example.
- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case  $U, V$  is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

### scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale\_units* parameter.

**scale\_units**

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the `scale` kwarg is `None`, the arrow length unit. Default is `None`.

e.g. `scale_units` is 'inches', `scale` is 2.0, and  $(u, v) = (1, 0)$ , then the vector will be 0.5 inches long.

If `scale_units` is 'width' or 'height', then the vector will be half the width/height of the axes.

If `scale_units` is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy'`, `scale_units='xy'`, `scale=1`.

**width**

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth**

[float, default: 3] Head width as multiple of shaft width.

**headlength**

[float, default: 5] Head length as multiple of shaft width.

**headaxislength**

[float, default: 4.5] Head length at shaft intersection.

**minshaft**

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength**

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot**

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

**color**

[color or color sequence, optional] Explicit color(s) for the arrows. If `C` has been set, `color` has no effect.

This is a synonym for the `PolyCollection` `facecolor` parameter.

**Other Parameters**

**\*\*kwargs**

[*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a dpi value, and returns
<i>alpha</i>	array-like or scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa or antialiaseds	bool or list of bools
<i>array</i>	ndarray or None
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or ec or edgecolors	color or list of colors or 'face'
<i>facecolor</i> or facecolors or fc	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '!', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or dashes or linestyles or ls	str or tuple or list thereof
<i>linewidth</i> or linewidths or lw	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	(N, 2) or (2,) array-like
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>pickradius</i>	float
<i>rasterized</i>	bool
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

See also:

**Axes.quiverkey**

Add a key to a quiver plot.

**Examples using `matplotlib.axes.Axes.quiver`**

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_simple\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_trigradient\_demo.py
- sphx\_glr\_gallery\_mplot3d\_quiver3d.py

**matplotlib.axes.Axes.quiverkey**

`Axes.quiverkey(self, Q, X, Y, U, label, **kw)`

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

**Parameters****Q**

[[matplotlib.quiver.Quiver](#)] A *Quiver* object as returned by a call to *quiver()*.

**X, Y**

[float] The location of the key.

**U**

[float] The length of the key.

**label**

[str] The key label (e.g., length and units of the key).

**angle**

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

**coordinates**

[{'axes': 'figure', 'data': 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the

locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

**color**

[color] Overrides face and edge colors from  $Q$ .

**labelpos**

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

**labelsep**

[float, default: 0.1] Distance in inches between the arrow and the label.

**labelcolor**

[color, default: `rcParams["text.color"]`] (default: 'black') Label color.

**fontproperties**

[dict, optional] A dictionary with keyword arguments accepted by the `FontProperties` initializer: *family*, *style*, *variant*, *size*, *weight*.

**\*\*kwargs**

Any additional keyword arguments are used to override vector properties taken from  $Q$ .

## Examples using `matplotlib.axes.Axes.quiverkey`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_simple\_demo.py

## matplotlib.axes.Axes.streamplot

`Axes.streamplot`(*axes*, *x*, *y*, *u*, *v*, *density*=1, *linewidth*=None, *color*=None, *cmap*=None, *norm*=None, *arrowsize*=1, *arrowstyle*='->', *minlength*=0.1, *transform*=None, *zorder*=None, *start\_points*=None, *maxlength*=4.0, *integration\_direction*='both', \*, *data*=None)

Draw streamlines of a vector flow.

### Parameters

**x, y**

[1D/2D arrays] Evenly spaced strictly increasing arrays to make a grid.

**u, v**

[2D arrays]  $x$  and  $y$ -velocities. The number of rows and columns must match the length of  $y$  and  $x$ , respectively.

**density**

[float or (float, float)] Controls the closeness of streamlines. When `density` = 1, the domain is divided into a 30x30 grid. `density` linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (`density_x`, `density_y`).

**linewidth**

[float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as  $u$  and  $v$ .

**color**

[color or 2D array] The streamline color. If given an array, its values are converted to colors using `cmap` and `norm`. The array must have the same shape as  $u$  and  $v$ .

**cmap**

[[Colormap](#)] Colormap used to plot streamlines and arrows. This is only used if `color` is an array.

**norm**

[[Normalize](#)] Normalize object used to scale luminance data to 0, 1. If `None`, stretch (min, max) to (0, 1). This is only used if `color` is an array.

**arrowsize**

[float] Scaling factor for the arrow size.

**arrowstyle**

[str] Arrow style specification. See [FancyArrowPatch](#).

**minlength**

[float] Minimum length of streamline in axes coordinates.

**start\_points**

[Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the  $x$  and  $y$  arrays).

**zorder**

[int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

**maxlength**

[float] Maximum length of streamline in axes coordinates.

**integration\_direction**

[{'forward', 'backward', 'both'}, default: 'both'] Integrate the streamline in forward, backward or both directions.

## Returns

### StreamplotSet

Container object with attributes

- `lines`: `LineCollection` of streamlines
- `arrows`: `PatchCollection` containing `FancyArrowPatch` objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x, y, u, v, start_points`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.axes.Axes.streamplot`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_plot\_streamplot.py

## 18.5.5 Clearing

---

<code>Axes.cla</code>	Clear the axes.
<code>Axes.clear</code>	Clear the axes.

---

## matplotlib.axes.Axes.cla

`Axes.cla(self)`  
Clear the axes.

### Examples using `matplotlib.axes.Axes.cla`

- sphx\_glr\_gallery\_animation\_animation\_demo.py
- sphx\_glr\_gallery\_event\_handling\_data\_browser.py

### `matplotlib.axes.Axes.clear`

`Axes.clear(self)`

Clear the axes.

### Examples using `matplotlib.axes.Axes.clear`

## 18.5.6 Appearance

<code>Axes.axis</code>	Convenience method to get or set some axis properties.
<code>Axes.set_axis_off</code>	Turn the x- and y-axis off.
<code>Axes.set_axis_on</code>	Turn the x- and y-axis on.
<code>Axes.set_frame_on</code>	Set whether the axes rectangle patch is drawn.
<code>Axes.get_frame_on</code>	Get whether the axes rectangle patch is drawn.
<code>Axes.set_axisbelow</code>	Set whether axis ticks and gridlines are above or below most artists.
<code>Axes.get_axisbelow</code>	Get whether axis ticks and gridlines are above or below most artists.
<code>Axes.grid</code>	Configure the grid lines.
<code>Axes.get_facecolor</code>	Get the facecolor of the Axes.
<code>Axes.set_facecolor</code>	Set the facecolor of the Axes.

### `matplotlib.axes.Axes.axis`

`Axes.axis(self, *args, emit=True, **kwargs)`

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

#### Parameters

**xmin, xmax, ymin, ymax**

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

### option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as <code>True</code> .
'off'	Turn off axis lines and labels. Same as <code>False</code> .
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code> . Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code> . Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin == ymax-ymin</code> .

### emit

[bool, default: `True`] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

### Returns

#### xmin, xmax, ymin, ymax

[float] The axis limits.

### See also:

`matplotlib.axes.Axes.set\_xlim`

`matplotlib.axes.Axes.set\_ylim`

## matplotlib.axes.Axes.set\_axis\_off

Axes.**set\_axis\_off**(*self*)

Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

### Examples using matplotlib.axes.Axes.set\_axis\_off

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_marker\_reference.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_barcode\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_transparency\_blend.py
- sphx\_glr\_gallery\_pie\_and\_polar\_charts\_nested\_pie.py
- *Choosing Colormaps in Matplotlib*
- *Text properties and layout*

## matplotlib.axes.Axes.set\_axis\_on

Axes.**set\_axis\_on**(*self*)

Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

### Examples using matplotlib.axes.Axes.set\_axis\_on

## matplotlib.axes.Axes.set\_frame\_on

Axes.**set\_frame\_on**(*self, b*)

Set whether the axes rectangle patch is drawn.

### Parameters

**b**

[bool]

### Examples using `matplotlib.axes.Axes.set_frame_on`

#### `matplotlib.axes.Axes.get_frame_on`

`Axes.get_frame_on(self)`

Get whether the axes rectangle patch is drawn.

### Examples using `matplotlib.axes.Axes.get_frame_on`

#### `matplotlib.axes.Axes.set_axisbelow`

`Axes.set_axisbelow(self, b)`

Set whether axis ticks and gridlines are above or below most artists.

This controls the zorder of the ticks and gridlines. For more information on the zorder see /gallery/misc/zorder\_demo.

##### Parameters

**b**

[bool or 'line'] Possible values:

- *True* (zorder = 0.5): Ticks and gridlines are below all Artists.
- 'line' (zorder = 1.5): Ticks and gridlines are above patches (e.g. rectangles, with default zorder = 1) but still below lines and markers (with their default zorder = 2).
- *False* (zorder = 2.5): Ticks and gridlines are above patches and lines / markers.

See also:

`get_axisbelow`

### Examples using `matplotlib.axes.Axes.set_axisbelow`

#### `matplotlib.axes.Axes.get_axisbelow`

`Axes.get_axisbelow(self)`

Get whether axis ticks and gridlines are above or below most artists.

##### Returns

bool or 'line'

See also:

`set_axisbelow`

## Examples using `matplotlib.axes.Axes.get_axisbelow`

### `matplotlib.axes.Axes.grid`

`Axes.grid(self, b=None, which='major', axis='both', **kwargs)`

Configure the grid lines.

#### Parameters

##### `b`

[bool or None, optional] Whether to show the grid lines. If any `kwargs` are supplied, it is assumed you want the grid on and `b` will be set to True.

If `b` is `None` and there are no `kwargs`, this toggles the visibility of the lines.

##### `which`

[{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

##### `axis`

[{'both', 'x', 'y'}, optional] The axis to apply the changes on.

##### `**kwargs`

[`Line2D` properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str

continues on

Table 97 – continued from previous page

Property	Description
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', " ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

## Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the `Line2D` objects comprising the grid. Therefore, to set grid zorder, use `set_axisbelow` or, for more control, call the `set_zorder` method of each axis.

### `matplotlib.axes.Axes.get_facecolor`

`Axes.get_facecolor(self)`

Get the facecolor of the Axes.

### Examples using `matplotlib.axes.Axes.get_facecolor`

### `matplotlib.axes.Axes.set_facecolor`

`Axes.set_facecolor(self, color)`

Set the facecolor of the Axes.

#### Parameters

##### `color`

[color]

### Examples using `matplotlib.axes.Axes.set_facecolor`

- sphx\_glr\_gallery\_color\_color\_demo.py

## 18.5.7 Property cycle

---

### `Axes.set_prop_cycle`

Set the property cycle of the Axes.

---

### `matplotlib.axes.Axes.set_prop_cycle`

`Axes.set_prop_cycle(self, *args, **kwargs)`

Set the property cycle of the Axes.

The property cycle controls the style properties such as color, marker and linestyle of future plot commands. The style properties of data already added to the Axes are not modified.

Call signatures:

```
set_prop_cycle(cycler)
set_prop_cycle(label=values[, label2=values2[, ...]])
set_prop_cycle(label, values)
```

Form 1 sets given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously and set it as the property cycle of the axes. If multiple properties are given, their value lists must have the same length. This is just a shortcut for explicitly creating a cycler and passing it to the function, i.e. it's short for `set_prop_cycle(cycler(label=values label2=values2, ...))`.

Form 3 creates a `Cycler` for a single property and set it as the property cycle of the axes. This form exists for compatibility with the original `cycler.cycler` interface. Its use is discouraged in favor of the kwarg form, i.e. `set_prop_cycle(label=values)`.

## Parameters

### `cycler`

[Cycler] Set the given Cycler. *None* resets to the cycle defined by the current style.

### `label`

[str] The property key. Must be a valid `Artist` property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

### `values`

[iterable] Finite-length iterable of the property values. These values are validated and will raise a `ValueError` if invalid.

## See also:

### `matplotlib.rcParams.cycler`

Convenience function for creating validated cyclers for properties.

### `cycler.cycler`

The original function for creating unvalidated cyclers.

## Examples

Setting the property cycle for a single property:

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'])
```

Setting the property cycle for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'],
...                     marker=['o', '+', 'x'])
```

## Examples using `matplotlib.axes.Axes.set_prop_cycle`

- sphx\_glr\_gallery\_showcase\_bachelors\_degrees\_by\_gender.py
- *Styling with cycler*

## 18.5.8 Axis / limits

<code>Axes.get_xaxis</code>	Return the XAxis instance.
<code>Axes.get_yaxis</code>	Return the YAxis instance.

### matplotlib.axes.Axes.get\_xaxis

`Axes.get_xaxis(self)`  
Return the XAxis instance.

The use of this function is discouraged. You should instead directly access the attribute `ax.xaxis`.

### Examples using matplotlib.axes.Axes.get\_xaxis

### matplotlib.axes.Axes.get\_yaxis

`Axes.get_yaxis(self)`  
Return the YAxis instance.

The use of this function is discouraged. You should instead directly access the attribute `ax.yaxis`.

### Examples using matplotlib.axes.Axes.get\_yaxis

## Axis limits and direction

<code>Axes.invert_xaxis</code>	Invert the x-axis.
<code>Axes.xaxis_inverted</code>	Return whether the xaxis is oriented in the "inverse" direction.
<code>Axes.invert_yaxis</code>	Invert the y-axis.
<code>Axes.yaxis_inverted</code>	Return whether the yaxis is oriented in the "inverse" direction.
<code>Axes.set_xlim</code>	Set the x-axis view limits.
<code>Axes.get_xlim</code>	Return the x-axis view limits.
<code>Axes.set_ylim</code>	Set the y-axis view limits.
<code>Axes.get_ylim</code>	Return the y-axis view limits.
<code>Axes.update_datalim</code>	Extend the <code>dataLim</code> Bbox to include the given points.
<code>Axes.update_datalim_bounds</code>	[Deprecated] Extend the <code>dataLim</code> Bbox to include the given <code>Bbox</code> .
<code>Axes.set_xbound</code>	Set the lower and upper numerical bounds of the x-axis.
<code>Axes.get_xbound</code>	Return the lower and upper x-axis bounds, in increasing order.

---

**matplotlib.axes.Axes.invert\_xaxis**`Axes.invert_xaxis(self)`

Invert the x-axis.

**See also:**`xaxis_inverted``get_xlim, set_xlim``get_xbound, set_xbound`**Examples using matplotlib.axes.Axes.invert\_xaxis****matplotlib.axes.Axes.xaxis\_inverted**`Axes.xaxis_inverted(self)`

Return whether the xaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

**Examples using matplotlib.axes.Axes.xaxis\_inverted****matplotlib.axes.Axes.invert\_yaxis**`Axes.invert_yaxis(self)`

Invert the y-axis.

**See also:**`yaxis_inverted``get_ylim, set_ylim``get_ybound, set_ybound`

## Examples using `matplotlib.axes.Axes.invert_yaxis`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_bar\_label\_demo.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_barh.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_marker\_reference.py

## `matplotlib.axes.Axes.yaxis_inverted`

`Axes.yaxis_inverted(self)`

Return whether the yaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

## Examples using `matplotlib.axes.Axes.yaxis_inverted`

## `matplotlib.axes.Axes.set_xlim`

`Axes.set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)`

Set the x-axis view limits.

### Parameters

#### `left`

[float, optional] The left xlim in data coordinates. Passing `None` leaves the limit unchanged.

The left and right xlims may also be passed as the tuple `(left, right)` as the first positional argument (or as the `left` keyword argument).

#### `right`

[float, optional] The right xlim in data coordinates. Passing `None` leaves the limit unchanged.

#### `emit`

[bool, default: True] Whether to notify observers of limit change.

#### `auto`

[bool or None, default: False] Whether to turn on autoscaling of the x-axis. True turns on, False turns off, None leaves unchanged.

#### `xmin, xmax`

[float, optional] They are equivalent to `left` and `right` respectively, and it is an error to pass both `xmin` and `left` or `xmax` and `right`.

## Returns

**left, right**

[(float, float)] The new x-axis limits in data coordinates.

See also:

[get\\_xlim](#)

[set\\_xbound, get\\_xbound](#)

[invert\\_xaxis, xaxis\\_inverted](#)

## Notes

The *left* value may be greater than the *right* value, in which case the x-axis values will decrease from left to right.

## Examples

```
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```
>>> set_xlim(right=right_lim)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose *x* represents the number of years before present. The x-axis limits might be set like the following so 5000 years ago is on the left of the plot and the present is on the right.

```
>>> set_xlim(5000, 0)
```

### `matplotlib.axes.Axes.get_xlim`

`Axes.get_xlim(self)`  
Return the x-axis view limits.

#### Returns

**left, right**

[float, float] The current x-axis limits in data coordinates.

#### See also:

[`set\_xlim`](#)

[`set\_xbound, get\_xbound`](#)

[`invert\_xaxis, xaxis\_inverted`](#)

#### Notes

The x-axis may be inverted, in which case the *left* value will be greater than the *right* value.

### Examples using `matplotlib.axes.Axes.get_xlim`

- [Decay](#)

### `matplotlib.axes.Axes.set_ylim`

`Axes.set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)`  
Set the y-axis view limits.

#### Parameters

##### **bottom**

[float, optional] The bottom ylim in data coordinates. Passing *None* leaves the limit unchanged.

The bottom and top ylims may also be passed as the tuple (*bottom, top*) as the first positional argument (or as the *bottom* keyword argument).

**top**

[float, optional] The top ylim in data coordinates. Passing *None* leaves the limit unchanged.

**emit**

[bool, default: True] Whether to notify observers of limit change.

**auto**

[bool or None, default: False] Whether to turn on autoscaling of the y-axis. *True* turns on, *False* turns off, *None* leaves unchanged.

**ymin, ymax**

[float, optional] They are equivalent to bottom and top respectively, and it is an error to pass both *ymin* and *bottom* or *ymax* and *top*.

**Returns****bottom, top**

[(float, float)] The new y-axis limits in data coordinates.

**See also:**

[get\\_ylim](#)

[set\\_ybound, get\\_ybound](#)

[invert\\_yaxis, yaxis\\_inverted](#)

**Notes**

The *bottom* value may be greater than the *top* value, in which case the y-axis values will decrease from *bottom* to *top*.

**Examples**

```
>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)
```

One limit may be left unchanged.

```
>>> set_ylim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose *y* represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```
>>> set_ylim(5000, 0)
```

### `matplotlib.axes.Axes.get_ylim`

`Axes.get_ylim(self)`

Return the y-axis view limits.

#### Returns

**bottom, top**

[(float, float)] The current y-axis limits in data coordinates.

See also:

`set_ylim`

`set_ybound, get_ybound`

`invert_yaxis, yaxis_inverted`

## Notes

The y-axis may be inverted, in which case the *bottom* value will be greater than the *top* value.

### Examples using `matplotlib.axes.Axes.get_ylim`

- sphx\_glr\_gallery\_shapes\_and\_collections\_collections.py

### matplotlib.axes.Axes.update\_datalim

`Axes.update_datalim(self, xys, updatex=True, updatey=True)`

Extend the `dataLim` Bbox to include the given points.

If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the `xydata` (`xys`). Otherwise, it will compute the bounds of the union of its current data and the data in `xys`.

#### Parameters

##### `xys`

[2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a Nx2 array.

##### `updatex, updatey`

[bool, default: True] Whether to update the x/y limits.

### Examples using `matplotlib.axes.Axes.update_datalim`

### matplotlib.axes.Axes.update\_datalim\_bounds

`Axes.update_datalim_bounds(self, bounds)`

[*Deprecated*] Extend the `datalim` Bbox to include the given `Bbox`.

#### Parameters

##### `bounds`

[*Bbox*]

### Notes

Deprecated since version 3.3.

### Examples using `matplotlib.axes.Axes.update_datalim_bounds`

#### `matplotlib.axes.Axes.set_xbound`

`Axes.set_xbound(self, lower=None, upper=None)`

Set the lower and upper numerical bounds of the x-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (`get_autoscalex_on()`).

##### Parameters

###### `lower, upper`

[float or None] The lower and upper bounds. If `None`, the respective axis bound is not modified.

See also:

`get_xbound`

`get_xlim, set_xlim`

`invert_xaxis, xaxis_inverted`

### Examples using `matplotlib.axes.Axes.set_xbound`

#### `matplotlib.axes.Axes.get_xbound`

`Axes.get_xbound(self)`

Return the lower and upper x-axis bounds, in increasing order.

See also:

`set_xbound`

`get_xlim, set_xlim`

`invert_xaxis, xaxis_inverted`

## Examples using `matplotlib.axes.Axes.get_xbound`

### `matplotlib.axes.Axes.set_ybound`

`Axes.set_ybound(self, lower=None, upper=None)`

Set the lower and upper numerical bounds of the y-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (`get_autoscaley_on()`).

#### Parameters

##### `lower, upper`

[float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

#### See also:

`get_ybound`

`get_ylim, set_ylim`

`invert_yaxis, yaxis_inverted`

## Examples using `matplotlib.axes.Axes.set_ybound`

### `matplotlib.axes.Axes.get_ybound`

`Axes.get_ybound(self)`

Return the lower and upper y-axis bounds, in increasing order.

#### See also:

`set_ybound`

`get_ylim, set_ylim`

`invert_yaxis, yaxis_inverted`

## Examples using `matplotlib.axes.Axes.get_ybound`

### Axis labels, title, and legend

---

`Axes.set_xlabel`

Set the label for the x-axis.

---

`Axes.get_xlabel`

Get the xlabel text string.

---

`Axes.set_ylabel`

Set the label for the y-axis.

continues on next page

Table 101 – continued from previous page

<code>Axes.get_ylabel</code>	Get the ylabel text string.
<code>Axes.set_title</code>	Set a title for the Axes.
<code>Axes.get_title</code>	Get an Axes title.
<code>Axes.legend</code>	Place a legend on the Axes.
<code>Axes.get_legend</code>	Return the <code>Legend</code> instance, or None if no legend is defined.
<code>Axes.get_legend_handles_labels</code>	Return handles and labels for legend

## **matplotlib.axes.Axes.set\_xlabel**

`Axes.set_xlabel`(*self*, *xlabel*, *fontdict=None*, *labelpad=None*, \*, *loc=None*, \*\**kwargs*)

Set the label for the x-axis.

### **Parameters**

#### **xlabel**

[str] The label text.

#### **labelpad**

[float, default: `rcParams["axes.labelpad"]` (default: 4.0)] Spacing in points from the axes bounding box including ticks and tick labels. If None, the previous value is left as is.

#### **loc**

[{'left', 'center', 'right'}, default: `rcParams["xaxis.labellocation"]` (default: 'center')] The label position. This is a high-level alternative for passing parameters *x* and *horizontalalignment*.

### **Other Parameters**

#### **\*\*kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

### **See also:**

#### **text**

Documents the properties supported by *Text*.

## matplotlib.axes.Axes.get\_xlabel

Axes.**get\_xlabel**(*self*)

Get the xlabel text string.

**Examples using `matplotlib.axes.Axes.get_xlabel`****`matplotlib.axes.Axes.set_ylabel`**

`Axes.set_ylabel(self, ylabel, fontdict=None, labelpad=None, *, loc=None, **kwargs)`

Set the label for the y-axis.

**Parameters****`ylabel`**

[str] The label text.

**`labelpad`**

[float, default: `rcParams["axes.labelpad"]`] (default: 4.0)] Spacing in points from the axes bounding box including ticks and tick labels. If None, the previous value is left as is.

**`loc`**

[{'bottom', 'center', 'top'}, default: `rcParams["yaxis.labellocation"]` (default: 'center')] The label position. This is a high-level alternative for passing parameters `y` and `horizontalalignment`.

**Other Parameters****`**kwargs`**

[`Text` properties] `Text` properties control the appearance of the label.

**See also:****`text`**

Documents the properties supported by `Text`.

**Examples using `matplotlib.axes.Axes.set_ylabel`**

## `matplotlib.axes.Axes.get_ylabel`

`Axes.get_ylabel(self)`

Get the ylabel text string.

## Examples using `matplotlib.axes.Axes.get_ylabel`

## `matplotlib.axes.Axes.set_title`

`Axes.set_title(self, label, fontdict=None, loc=None, pad=None, *, y=None, **kwargs)`

Set a title for the Axes.

Set one of the three available Axes titles. The available titles are positioned above the Axes in the center, flush with the left edge, and flush with the right edge.

### Parameters

#### `label`

[str] Text to use for the title

#### `fontdict`

[dict] A dictionary controlling the appearance of the title text, the default `fontdict` is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

#### `loc`

[{'center', 'left', 'right'}, default: `rcParams["axes.titlelocation"]` (default: 'center')] Which title to set.

**y**

[float, default: `rcParams["axes.titley"]`] (default: None) Vertical Axes location for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the Axes.

**pad**

[float, default: `rcParams["axes.titlepad"]`] (default: 6.0) The offset of the title from the top of the Axes, in points.

### Returns

*Text*

The matplotlib text instance representing the title

### Other Parameters

**\*\*kwargs**

[*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

## `matplotlib.axes.Axes.get_title`

`Axes.get_title(self, loc='center')`

Get an Axes title.

Get one of the three available Axes titles. The available titles are positioned above the Axes in the center, flush with the left edge, and flush with the right edge.

### Parameters

`loc`

[{'center', 'left', 'right'}, str, default: 'center'] Which title to return.

### Returns

`str`

The title text string.

## Examples using `matplotlib.axes.Axes.get_title`

## `matplotlib.axes.Axes.legend`

`Axes.legend(self, *args, **kwargs)`

Place a legend on the Axes.

Call signatures:

```
legend()  
legend(labels)  
legend(handles, labels)
```

The call signatures correspond to these three different ways to use this method:

### 1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')  
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])  
line.set_label('Label via method')  
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Axes.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

## 2. Labeling existing plot elements

To make a legend for lines which already exist on the Axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

## 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
ax.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

### Parameters

#### handles

[sequence of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

#### labels

[list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

### Returns

#### `Legend`

### Other Parameters

#### loc

[str or pair of floats, default: `rcParams["legend.loc"]`] (default: 'best') ('best' for axes, 'upper right' for figures) The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

### `bbox_to_anchor`

[`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox (`x`, `y`, `width`, `height`) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (`x`, `y`) places the corner of the legend specified by `loc` at `x`, `y`. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol**

[int, default: 1] The number of columns that the legend has.

**prop**

[None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

**labelcolor**

[str or list] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints**

[int, default: `rcParams["legend.numpoints"]`] (default: 1) The number of marker points in the legend when creating a legend entry for a `Line2D` (line).

**scatterpoints**

[int, default: `rcParams["legend.scatterpoints"]`] (default: 1) The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot).

**scatteryoffsets**

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale**

[float, default: `rcParams["legend.markerscale"]`] (default: 1.0) The relative size of legend markers compared with the originally drawn ones.

**markerfirst**

[bool, default: True] If `True`, legend marker is placed to the left of the legend label. If `False`, legend marker is placed to the right of the legend label.

**frameon**

[bool, default: `rcParams["legend.frameon"]`] (default: `True`) Whether the legend should be drawn on a patch (frame).

#### fancybox

[bool, default: `rcParams["legend.fancybox"]`] (default: `True`) Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.

#### shadow

[bool, default: `rcParams["legend.shadow"]`] (default: `False`) Whether to draw a shadow behind the legend.

#### framealpha

[float, default: `rcParams["legend.framealpha"]`] (default: `0.8`) The alpha transparency of the legend's background. If `shadow` is activated and `framealpha` is `None`, the default value is ignored.

#### facecolor

[`"inherit"` or color, default: `rcParams["legend.facecolor"]`] (default: `'inherit'`) The legend's background color. If `"inherit"`, use `rcParams["axes.facecolor"]` (default: `'white'`).

#### edgecolor

[`"inherit"` or color, default: `rcParams["legend.edgecolor"]`] (default: `'0.8'`) The legend's background patch edge color. If `"inherit"`, use take `rcParams["axes.edgecolor"]` (default: `'black'`).

#### mode

[`{"expand", None}`] If `mode` is set to `"expand"` the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend's size).

#### bbox\_transform

[`None` or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.

#### title

[str or `None`] The legend's title. Default is no title (`None`).

#### title\_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]`] (default: `None`) The font size of the legend's title.

#### borderpad

[float, default: `rcParams["legend.borderpad"]`] (default: `0.4`) The fractional whitespace inside the legend border, in font-size units.

**labelspacing**

[float, default: `rcParams["legend.labelspacing"]`] (default: 0.5)  
The vertical space between the legend entries, in font-size units.

**handlelength**

[float, default: `rcParams["legend.handlelength"]`] (default: 2.0)  
The length of the legend handles, in font-size units.

**handletextpad**

[float, default: `rcParams["legend.handletextpad"]`] (default: 0.8)  
The pad between the legend handle and text, in font-size units.

**borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]`] (default: 0.5)  
The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: `rcParams["legend.columnspacing"]`] (default: 2.0)  
The spacing between columns, in font-size units.

**handler\_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

See also:

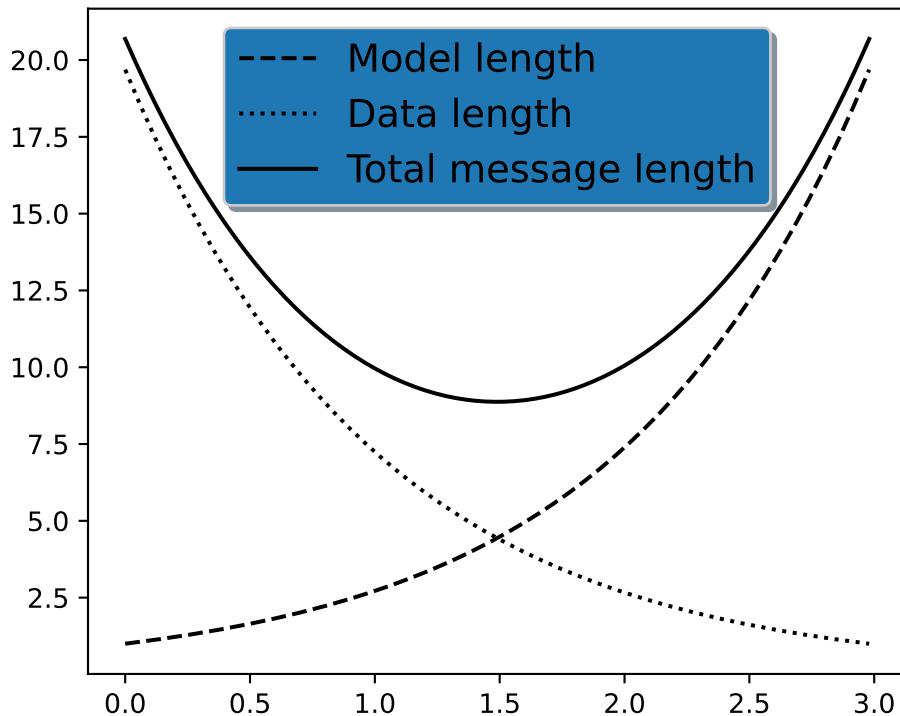

`Figure.legend`

**Notes**

Some artists are not supported by this function. See `Legend guide` for details.

### **matplotlib.axes.Axes.get\_legend**

`Axes.get_legend(self)`

Return the [Legend](#) instance, or None if no legend is defined.

### **Examples using matplotlib.axes.Axes.get\_legend**

#### **matplotlib.axes.Axes.get\_legend\_handles\_labels**

`Axes.get_legend_handles_labels(self, legend_handler_map=None)`

Return handles and labels for legend

`ax.legend()` is equivalent to

```
h, l = ax.get_legend_handles_labels()  
ax.legend(h, l)
```

## Examples using `matplotlib.axes.Axes.get_legend_handles_labels`

- *Legend guide*

## Axis scales

<code>Axes.set_xscale</code>	Set the x-axis scale.
<code>Axes.get_xscale</code>	Return the xaxis' scale (as a str).
<code>Axes.set_yscale</code>	Set the y-axis scale.
<code>Axes.get_yscale</code>	Return the yaxis' scale (as a str).

### `matplotlib.axes.Axes.set_xscale`

`Axes.set_xscale(self, value, **kwargs)`

Set the x-axis scale.

#### Parameters

##### `value`

[{"linear", "log", "symlog", "logit", ...} or *ScaleBase*] The axis scale type to apply.

##### `**kwargs`

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`
- `matplotlib.scale.FuncScale`

### Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

### Examples using `matplotlib.axes.Axes.set_xscale`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_markevery\_demo.py

- sphx\_glr\_gallery\_scales\_symlog\_demo.py
- *Transformations Tutorial*

### `matplotlib.axes.Axes.get_xscale`

`Axes.get_xscale(self)`

Return the xaxis' scale (as a str).

### Examples using `matplotlib.axes.Axes.get_xscale`

### `matplotlib.axes.Axes.set_yscale`

`Axes.set_yscale(self, value, **kwargs)`

Set the y-axis scale.

#### Parameters

##### `value`

[{"linear", "log", "symlog", "logit", ...} or `ScaleBase`] The axis scale type to apply.

##### `**kwargs`

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`

- `matplotlib.scale.LogitScale`
- `matplotlib.scale.FuncScale`

## Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

### Examples using `matplotlib.axes.Axes.set_yscale`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_markevery\_demo.py
- sphx\_glr\_gallery\_statistics\_boxplot.py

- sphx\_glr\_gallery\_scales\_log\_demo.py
- sphx\_glr\_gallery\_scales\_scales.py
- sphx\_glr\_gallery\_scales\_symlog\_demo.py

### `matplotlib.axes.Axes.get_yscale`

`Axes.get_yscale(self)`

Return the yaxis' scale (as a str).

### Examples using `matplotlib.axes.Axes.get_yscale`

## Autoscaling and margins

<code>Axes.use_sticky_edges</code>	When autoscaling, whether to obey all Artist. <code>sticky_edges</code> .
<code>Axes.margins</code>	Set or retrieve autoscaling margins.
<code>Axes.set_xmargin</code>	Set padding of X data limits prior to autoscaling.
<code>Axes.set_ymargin</code>	Set padding of Y data limits prior to autoscaling.
<code>Axes.relim</code>	Recompute the data limits based on current artists.
<code>Axes.autoscale</code>	Autoscale the axis view to the data (toggle).
<code>Axes.autoscale_view</code>	Autoscale the view limits using the data limits.

continues on next page

Table 103 – continued from previous page

<code>Axes.set_autoscale_on</code>	Set whether autoscaling is applied to axes on the next draw or call to <code>Axes.autoscale_view</code> .
<code>Axes.get_autoscale_on</code>	Get whether autoscaling is applied for both axes on plot commands
<code>Axes.set_autoscalex_on</code>	Set whether autoscaling for the x-axis is applied to axes on the next draw or call to <code>Axes.autoscale_view</code> .
<code>Axes.get_autoscalex_on</code>	Get whether autoscaling for the x-axis is applied on plot commands
<code>Axes.set_autoscaley_on</code>	Set whether autoscaling for the y-axis is applied to axes on the next draw or call to <code>Axes.autoscale_view</code> .
<code>Axes.get_autoscaley_on</code>	Get whether autoscaling for the y-axis is applied on plot commands

### `matplotlib.axes.Axes.use_sticky_edges`

#### `property Axes.use_sticky_edges`

When autoscaling, whether to obey all `Artist.sticky_edges`.

Default is `True`.

Setting this to `False` ensures that the specified margins will be applied, even if the plot includes an image, for example, which would otherwise force a view limit to coincide with its data limit.

The changing this property does not change the plot until `autoscale` or `autoscale_view` is called.

### `matplotlib.axes.Axes.margins`

#### `Axes.margins (self, *margins, x=None, y=None, tight=True)`

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the `margin` times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a `TypeError`. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if `xmargin` is not `None`, then `xmargin` times the X data interval will be added to each end of that interval before it is used in autoscaling.

#### Parameters

##### `*margins`

[float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they

will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

### **x, y**

[float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

### **tight**

[bool or None, default: True] The *tight* parameter is passed to `auto_scale_view()`, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Set *tight* to *None* will preserve the previous setting.

### **Returns**

#### **xmargin, ymargin**

[float]

### **Notes**

If a previously used Axes method such as `pcolor()` has set `use_sticky_edges` to `True`, only the limits not set by the "sticky artists" will be modified. To force all of the margins to be set, set `use_sticky_edges` to `False` before calling `margins()`.

### **Examples using `matplotlib.axes.Axes.margins`**

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_marker\_reference.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_timeline.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_trigradient\_demo.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_margins.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_angle\_annotation.py
- sphx\_glr\_gallery\_style\_sheets\_ggplot.py
- sphx\_glr\_gallery\_widgets\_slider\_demo.py
- *Autoscaling*

### `matplotlib.axes.Axes.set_xmargin`

`Axes.set_xmargin(self, m)`

Set padding of X data limits prior to autoscaling.

$m$  times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of  $m = 0.1$  will result in a range [-0.2, 2.2].

Negative values  $-0.5 < m < 0$  will result in clipping of the data range. I.e. for a data range [0, 2], a factor of  $m = -0.1$  will result in a range [0.2, 1.8].

#### Parameters

**m**

[float greater than -0.5]

### Examples using `matplotlib.axes.Axes.set_xmargin`

### `matplotlib.axes.Axes.set_ymargin`

`Axes.set_ymargin(self, m)`

Set padding of Y data limits prior to autoscaling.

$m$  times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of  $m = 0.1$  will result in a range [-0.2, 2.2].

Negative values  $-0.5 < m < 0$  will result in clipping of the data range. I.e. for a data range [0, 2], a factor of  $m = -0.1$  will result in a range [0.2, 1.8].

#### Parameters

**m**

[float greater than -0.5]

### Examples using `matplotlib.axes.Axes.set_ymargin`

### `matplotlib.axes.Axes.relim`

`Axes.relim(self, visible_only=False)`

Recompute the data limits based on current artists.

At present, `Collection` instances are not supported.

#### Parameters

**visible\_only**

[bool, default: False] Whether to exclude invisible artists.

## Examples using `matplotlib.axes.Axes.relim`

- sphx\_glr\_gallery\_misc\_packed\_bubbles.py
- sphx\_glr\_gallery\_widgets\_textbox.py

## `matplotlib.axes.Axes.autoscale`

`Axes.autoscale(self, enable=True, axis='both', tight=None)`

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

### Parameters

#### `enable`

[bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

#### `axis`

[{'both', 'x', 'y'}, default: 'both'] Which axis to operate on.

#### `tight`

[bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to `autoscale_view` (regardless of its value); see the description of its behavior there.

## Examples using `matplotlib.axes.Axes.autoscale`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_box\_aspect.py
- *Autoscaling*

## `matplotlib.axes.Axes.autoscale_view`

`Axes.autoscale_view(self, tight=None, scalex=True, scaley=True)`

Autoscale the view limits using the data limits.

### Parameters

#### `tight`

[bool or None] If *True*, only expand the axis limits using the margins. Note that unlike for `autoscale`, `tight=True` does *not* set the margins to zero.

If `False` and `rcParams["axes.autolimit_mode"]` (default: 'data') is 'round\_numbers', then after expansion by the margins, further expand the axis limits using the axis major locator.

If `None` (the default), reuse the value set in the previous call to `autoscale_view` (the initial value is `False`, but the default style sets `rcParams["axes.autolimit_mode"]` (default: 'data') to 'data', in which case this behaves like `True`).

### `scalex`

[bool, default: `True`] Whether to autoscale the x axis.

### `scaley`

[bool, default: `True`] Whether to autoscale the y axis.

## Notes

The autoscaling preserves any preexisting axis direction reversal.

The data limits are not updated automatically when artist data are changed after the artist has been added to an `Axes` instance. In that case, use `matplotlib.axes.Axes.relim()` prior to calling `autoscale_view`.

If the views of the axes are fixed, e.g. via `set_xlim`, they will not be changed by `autoscale_view()`. See `matplotlib.axes.Axes.autoscale()` for an alternative.

## Examples using `matplotlib.axes.Axes.autoscale_view`

- sphx\_glr\_gallery\_shapes\_and\_collections\_collections.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_compound\_path.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_ellipse\_collection.py
- sphx\_glr\_gallery\_misc\_packed\_bubbles.py
- sphx\_glr\_gallery\_units\_bar\_unit\_demo.py
- sphx\_glr\_gallery\_widgets\_textbox.py
- *Autoscaling*

## matplotlib.axes.Axes.set\_yscale

Axes.**set\_yscale**(self, b)

Set whether autoscaling is applied to axes on the next draw or call to `Axes.autoscale_view`.

### Parameters

**b**

[bool]

## Examples using matplotlib.axes.Axes.set\_yscale

- sphx\_glr\_gallery\_event\_handling\_resample.py

## matplotlib.axes.Axes.get\_yscale

Axes.**get\_yscale**(self)

Get whether autoscaling is applied for both axes on plot commands

## Examples using matplotlib.axes.Axes.get\_yscale

## matplotlib.axes.Axes.set\_xscale

Axes.**set\_xscale**(self, b)

Set whether autoscaling for the x-axis is applied to axes on the next draw or call to `Axes.autoscale_view`.

### Parameters

**b**

[bool]

## Examples using matplotlib.axes.Axes.set\_xscale

## matplotlib.axes.Axes.get\_xscale

Axes.**get\_xscale**(self)

Get whether autoscaling for the x-axis is applied on plot commands

**Examples using `matplotlib.axes.Axes.get_autoscalex_on`****`matplotlib.axes.Axes.set_autoscaley_on`**

`Axes.set_autoscaley_on(self, b)`

Set whether autoscaling for the y-axis is applied to axes on the next draw or call to `Axes.autoscale_view`.

**Parameters**

**b**

[bool]

**Examples using `matplotlib.axes.Axes.set_autoscaley_on`****`matplotlib.axes.Axes.get_autoscaley_on`**

`Axes.get_autoscaley_on(self)`

Get whether autoscaling for the y-axis is applied on plot commands

**Examples using `matplotlib.axes.Axes.get_autoscaley_on`****Aspect ratio**

<code>Axes.apply_aspect</code>	Adjust the Axes for a specified data aspect ratio.
<code>Axes.set_aspect</code>	Set the aspect of the axis scaling, i.e. the ratio of y-unit to x-unit.
<code>Axes.get_aspect</code>	Set the axes box aspect, i.e. the ratio of height to width.
<code>Axes.get_box_aspect</code>	Return the axes box aspect, i.e. the ratio of height to width.
<code>Axes.set_adjustable</code>	Set how the Axes adjusts to achieve the required aspect ratio.
<code>Axes.get_adjustable</code>	Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

## `matplotlib.axes.Axes.apply_aspect`

`Axes.apply_aspect(self, position=None)`

Adjust the Axes for a specified data aspect ratio.

Depending on `get_adjustable` this will modify either the Axes box (position) or the view limits. In the former case, `get_anchor` will affect the position.

See also:

`matplotlib.axes.Axes.set_aspect`

For a description of aspect ratio handling.

`matplotlib.axes.Axes.set_adjustable`

Set how the Axes adjusts to achieve the required aspect ratio.

`matplotlib.axes.Axes.set_anchor`

Set the position in case of extra space.

## Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

## Examples using `matplotlib.axes.Axes.apply_aspect`

### `matplotlib.axes.Axes.set_aspect`

`Axes.set_aspect(self, aspect, adjustable=None, anchor=None, share=False)`

Set the aspect of the axis scaling, i.e. the ratio of y-unit to x-unit.

#### Parameters

##### `aspect`

[{'auto', 'equal'} or float] Possible values:

- 'auto': fill the position rectangle with data.
- 'equal': same as `aspect=1`, i.e. same scaling for x and y.
- `float`: A circle will be stretched such that the height is `float` times the width.

##### `adjustable`

[None or {'box', 'datalim'}, optional] If not None, this defines which parameter will be adjusted to meet the required aspect. See `set_adjustable` for further details.

**anchor**

[None or str or (float, float), optional] If not `None`, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to specify the anchor are abbreviations of cardinal directions:

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

See `set_anchor` for further details.

**share**

[bool, default: `False`] If `True`, apply the settings to all shared Axes.

**See also:****`matplotlib.axes.Axes.set_adjustable`**

Set how the Axes adjusts to achieve the required aspect ratio.

**`matplotlib.axes.Axes.set_anchor`**

Set the position in case of extra space.

## matplotlib.axes.Axes.get\_aspect

Axes.**get\_aspect**(*self*)

### Examples using matplotlib.axes.Axes.get\_aspect

## matplotlib.axes.Axes.set\_box\_aspect

Axes.**set\_box\_aspect**(*self*, *aspect=None*)

Set the axes box aspect, i.e. the ratio of height to width.

This defines the aspect of the axes in figure space and is not to be confused with the data aspect (see [set\\_aspect](#)).

### Parameters

#### aspect

[float or None] Changes the physical dimensions of the Axes, such that the ratio of the axes height to the axes width in physical units is equal to *aspect*. Defining a box aspect will change the *adjustable* property to 'datalim' (see [set\\_adjustable](#)).

*None* will disable a fixed box aspect so that height and width of the axes are chosen independently.

### See also:

`matplotlib.axes.Axes.set_aspect`

for a description of aspect handling.

**Examples using `matplotlib.axes.Axes.set_box_aspect`**

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_box\_aspect.py

**`matplotlib.axes.Axes.get_box_aspect`**

`Axes.get_box_aspect(self)`

Return the axes box aspect, i.e. the ratio of height to width.

The box aspect is `None` (i.e. chosen depending on the available figure space) unless explicitly specified.

**See also:**

`matplotlib.axes.Axes.set_box_aspect`

for a description of box aspect.

`matplotlib.axes.Axes.set_aspect`

for a description of aspect handling.

**Examples using `matplotlib.axes.Axes.get_box_aspect`**

**`matplotlib.axes.Axes.set_adjustable`**

`Axes.set_adjustable(self, adjustable, share=False)`

Set how the Axes adjusts to achieve the required aspect ratio.

**Parameters**

**adjustable**

[{'box', 'datalim'}] If 'box', change the physical dimensions of the Axes. If 'datalim', change the x or y data limits.

**share**

[bool, default: False] If `True`, apply the settings to all shared Axes.

**See also:**

`matplotlib.axes.Axes.set_aspect`

For a description of aspect handling.

## Notes

Shared Axes (of which twinned Axes are a special case) impose restrictions on how aspect ratios can be imposed. For twinned Axes, use 'datalim'. For Axes that share both x and y, use 'box'. Otherwise, either 'datalim' or 'box' may be used. These limitations are partly a requirement to avoid over-specification, and partly a result of the particular implementation we are currently using, in which the adjustments for aspect ratios are done sequentially and independently on each Axes as it is drawn.

### Examples using `matplotlib.axes.Axes.set_adjustable`

- sphx\_glr\_gallery\_scales\_aspect\_loglog.py

### `matplotlib.axes.Axes.get_adjustable`

`Axes.get_adjustable(self)`

Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

See also:

`matplotlib.axes.Axes.set_adjustable`

Set how the Axes adjusts to achieve the required aspect ratio.

`matplotlib.axes.Axes.set_aspect`

For a description of aspect handling.

### Examples using `matplotlib.axes.Axes.get_adjustable`

## Ticks and tick labels

<code>Axes.set_xticks</code>	Set the xaxis' tick locations.
<code>Axes.get_xticks</code>	Return the xaxis' tick locations in data coordinates.
<code>Axes.set_xticklabels</code>	Set the xaxis' labels with list of string labels.
<code>Axes.get_xticklabels</code>	Get the xaxis' tick labels.
<code>Axes.get_xmajorticklabels</code>	Return the xaxis' major tick labels, as a list of <code>Text</code> .
<code>Axes.get_xminorticklabels</code>	Return the xaxis' minor tick labels, as a list of <code>Text</code> .
<code>Axes.get_xgridlines</code>	Return the xaxis' grid lines as a list of <code>Line2Ds</code> .
<code>Axes.get_xticklines</code>	Return the xaxis' tick lines as a list of <code>Line2Ds</code> .
<code>Axes.xaxis_date</code>	Set up axis ticks and labels to treat data along the xaxis as dates.
<code>Axes.set_yticks</code>	Set the yaxis' tick locations.

continues on next page

Table 105 – continued from previous page

<code>Axes.get_yticks</code>	Return the yaxis' tick locations in data coordinates.
<code>Axes.set_yticklabels</code>	Set the yaxis' labels with list of string labels.
<code>Axes.get_yticklabels</code>	Get the yaxis' tick labels.
<code>Axes.get_ymajorticklabels</code>	Return the yaxis' major tick labels, as a list of <code>Text</code> .
<code>Axes.get_yminorticklabels</code>	Return the yaxis' minor tick labels, as a list of <code>Text</code> .
<code>Axes.get_ygridlines</code>	Return the yaxis' grid lines as a list of <code>Line2Ds</code> .
<code>Axes.get_yticklines</code>	Return the yaxis' tick lines as a list of <code>Line2Ds</code> .
<code>Axes.xaxis_date</code>	Set up axis ticks and labels to treat data along the yaxis as dates.
<code>Axes.minorticks_off</code>	Remove minor ticks from the axes.
<code>Axes.minorticks_on</code>	Display minor ticks on the axes.
<code>Axes.ticklabel_format</code>	Configure the <code>ScalarFormatter</code> used by default for linear axes.
<code>Axes.tick_params</code>	Change the appearance of ticks, tick labels, and gridlines.
<code>Axes.locator_params</code>	Control behavior of major tick locators.

## matplotlib.axes.Axes.set\_xticks

`Axes.set_xticks(self, ticks, *, minor=False)`

Set the xaxis' tick locations.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

### Parameters

#### ticks

[list of floats] List of tick locations.

#### minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

### Notes

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

### `matplotlib.axes.Axes.get_xticks`

`Axes.get_xticks(self, *, minor=False)`

Return the xaxis' tick locations in data coordinates.

### Examples using `matplotlib.axes.Axes.get_xticks`

### `matplotlib.axes.Axes.set_xticklabels`

`Axes.set_xticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)`

Set the xaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using `Axes.set_xticks`. Otherwise, the labels may end up in unexpected positions.

#### Parameters

##### `labels`

[list of str] The label texts.

##### `fontdict`

[dict, optional] A dictionary controlling the appearance of the ticklabels. The default `fontdict` is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': 'center'}
```

##### `minor`

[bool, default: False] Whether to set the minor ticklabels rather than the major ones.

#### Returns

##### `list of Text`

The labels.

#### Other Parameters

##### `**kwargs`

[`Text` properties.]

## `matplotlib.axes.Axes.get_xticklabels`

`Axes.get_xticklabels(self, minor=False, which=None)`

Get the xaxis' tick labels.

### Parameters

#### `minor`

[bool] Whether to return the minor or the major ticklabels.

#### `which`

[None, ('minor', 'major', 'both')] Overrides `minor`.

Selects which ticklabels to return

### Returns

`list of Text`

### Notes

The tick label strings are not populated until a `draw` method has been called.

See also: `draw` and `draw`.

### Examples using `matplotlib.axes.Axes.get_xticklabels`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_timeline.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_annotated\_heatmap.py

- *The Lifecycle of a Plot*

## `matplotlib.axes.Axes.get_xmajorticklabels`

`Axes.get_xmajorticklabels(self)`

Return the xaxis' major tick labels, as a list of `Text`.

### Examples using `matplotlib.axes.Axes.get_xmajorticklabels`

## `matplotlib.axes.Axes.get_xminorticklabels`

`Axes.get_xminorticklabels(self)`

Return the xaxis' minor tick labels, as a list of `Text`.

## Examples using `matplotlib.axes.Axes.get_xminorticklabels`

### `matplotlib.axes.Axes.get_xgridlines`

`Axes.get_xgridlines(self)`

Return the xaxis' grid lines as a list of `Line2Ds`.

## Examples using `matplotlib.axes.Axes.get_xgridlines`

### `matplotlib.axes.Axes.get_xticklines`

`Axes.get_xticklines(self, minor=False)`

Return the xaxis' tick lines as a list of `Line2Ds`.

## Examples using `matplotlib.axes.Axes.get_xticklines`

### `matplotlib.axes.Axes.xaxis_date`

`Axes.xaxis_date(self, tz=None)`

Set up axis ticks and labels to treat data along the xaxis as dates.

#### Parameters

##### `tz`

[str or `datetime.tzinfo`, default: `rcParams["timezone"]`] (default: 'UTC') The timezone used to create date labels.

## Examples using `matplotlib.axes.Axes.xaxis_date`

### `matplotlib.axes.Axes.set_yticks`

`Axes.set_yticks(self, ticks, *, minor=False)`

Set the yaxis' tick locations.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

#### Parameters

##### `ticks`

[list of floats] List of tick locations.

##### `minor`

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

## Notes

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

## `matplotlib.axes.Axes.get_yticks`

`Axes.get_yticks(self, *, minor=False)`

Return the yaxis' tick locations in data coordinates.

## Examples using `matplotlib.axes.Axes.get_yticks`

### `matplotlib.axes.Axes.set_yticklabels`

`Axes.set_yticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)`

Set the yaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using `Axes.set_yticks`. Otherwise, the labels may end up in unexpected positions.

#### Parameters

##### `labels`

[list of str] The label texts.

##### `fontdict`

[dict, optional] A dictionary controlling the appearance of the ticklabels. The default `fontdict` is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': 'center'}
```

##### `minor`

[bool, default: False] Whether to set the minor ticklabels rather than the major ones.

#### Returns

##### `list of Text`

The labels.

#### Other Parameters

##### `**kwargs`

[`Text` properties.]

### Examples using `matplotlib.axes.Axes.set_yticklabels`

### `matplotlib.axes.Axes.get_yticklabels`

`Axes.get_yticklabels(self, minor=False, which=None)`

Get the yaxis' tick labels.

#### Parameters

##### `minor`

[bool] Whether to return the minor or the major ticklabels.

##### `which`

[None, ('minor', 'major', 'both')] Overrides `minor`.

Selects which ticklabels to return

#### Returns

##### `list of Text`

## Notes

The tick label strings are not populated until a `draw` method has been called.

See also: `draw` and `draw`.

### Examples using `matplotlib.axes.Axes.get_yticklabels`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_fill\_between\_alpha.py
- sphx\_glr\_gallery\_axes\_grid1\_inset\_locator\_demo2.py

## `matplotlib.axes.Axes.get_ymajorticklabels`

`Axes.get_ymajorticklabels(self)`

Return the yaxis' major tick labels, as a list of `Text`.

### Examples using `matplotlib.axes.Axes.get_ymajorticklabels`

## `matplotlib.axes.Axes.get_yminorticklabels`

`Axes.get_yminorticklabels(self)`

Return the yaxis' minor tick labels, as a list of `Text`.

### Examples using `matplotlib.axes.Axes.get_yminorticklabels`

## `matplotlib.axes.Axes.get_ygridlines`

`Axes.get_ygridlines(self)`

Return the yaxis' grid lines as a list of `Line2D`s.

### Examples using `matplotlib.axes.Axes.get_ygridlines`

## `matplotlib.axes.Axes.get_yticklines`

`Axes.get_yticklines(self, minor=False)`

Return the yaxis' tick lines as a list of `Line2D`s.

### Examples using `matplotlib.axes.Axes.get_yticklines`

#### `matplotlib.axes.Axes.yaxis_date`

`Axes.yaxis_date(self, tz=None)`

Set up axis ticks and labels to treat data along the yaxis as dates.

##### Parameters

`tz`

[str or `datetime.tzinfo`, default: `rcParams["timezone"]`] (default: 'UTC') The timezone used to create date labels.

### Examples using `matplotlib.axes.Axes.yaxis_date`

#### `matplotlib.axes.Axes.minorticks_off`

`Axes.minorticks_off(self)`

Remove minor ticks from the axes.

### Examples using `matplotlib.axes.Axes.minorticks_off`

#### `matplotlib.axes.Axes.minorticks_on`

`Axes.minorticks_on(self)`

Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using `minorticks_off()` if drawing speed is a problem.

### Examples using `matplotlib.axes.Axes.minorticks_on`

- sphx\_glr\_gallery\_specialty\_plots\_mri\_with\_eeg.py

#### `matplotlib.axes.Axes.ticklabel_format`

`Axes.ticklabel_format(self, *, axis='both', style='', scilimits=None, useOffset=None, useLocale=None, useMathText=None)`

Configure the `ScalarFormatter` used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

##### Parameters

**axis**

[{'x', 'y', 'both'}, default: 'both'] The axes to configure. Only major ticks are affected.

**style**

[{'sci', 'scientific', 'plain'}] Whether to use scientific notation. The formatter default is to use scientific notation.

**scilimits**

[pair of ints (m, n)] Scientific notation is used only for numbers outside the range  $10^m$  to  $10^n$  (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where  $m \neq 0$  to fix the order of magnitude to  $10^m$ . The formatter default is `rcParams["axes.formatter.limits"]` (default: [-5, 6]).

**useOffset**

[bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is `rcParams["axes.formatter.useoffset"]` (default: True).

**useLocale**

[bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is `rcParams["axes.formatter.use_locale"]` (default: False).

**useMathText**

[bool] Render the offset and scientific notation in mathtext. The formatter default is `rcParams["axes.formatter.use_mathtext"]` (default: False).

**Raises****AttributeError**

If the current formatter is not a `ScalarFormatter`.

**Examples using `matplotlib.axes.Axes.ticklabel_format`**

- sphx\_glr\_gallery\_ticks\_and\_spines\_scalarformatter.py

**matplotlib.axes.Axes.tick\_params**

`Axes.tick_params(self, axis='both', **kwargs)`

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless `reset` is True.

**Parameters****axis**

[{'x', 'y', 'both'}, default: 'both'] The axis to which the parameters are applied.

**which**

[{'major', 'minor', 'both'}, default: 'major'] The group of ticks to which the parameters are applied.

**reset**

[bool, default: False] Whether to reset the ticks to defaults before updating them.

**Other Parameters****direction**

[{'in', 'out', 'inout'}] Puts ticks inside the axes, outside the axes, or both.

**length**

[float] Tick length in points.

**width**

[float] Tick width in points.

**color**

[color] Tick color.

**pad**

[float] Distance in points between tick and label.

**labelsize**

[float or str] Tick label font size in points or as a string (e.g., 'large').

**labelcolor**

[color] Tick label color.

**colors**

[color] Tick color and label color.

**zorder**

[float] Tick and label zorder.

**bottom, top, left, right**

[bool] Whether to draw the respective ticks.

**labelbottom, labeltop, labelleft, labelright**

[bool] Whether to draw the respective tick labels.

**labelrotation**

[float] Tick label rotation

**grid\_color**

[color] Gridline color.

**grid\_alpha**

[float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

**grid\_linewidth**

[float] Width of gridlines in points.

**grid\_linestyle**

[str] Any valid [Line2D](#) line style spec.

## Examples

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

## Examples using `matplotlib.axes.Axes.tick_params`

### **matplotlib.axes.Axes.locator\_params**

`Axes.locator_params(self, axis='both', tight=None, **kwargs)`  
Control behavior of major tick locators.

Because the locator is involved in autoscaling, `autoscale_view` is called automatically after the parameters are changed.

#### **Parameters**

##### **axis**

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate.

##### **tight**

[bool or None, optional] Parameter passed to `autoscale_view`. Default is None, for no change.

#### **Other Parameters**

##### **\*\*kwargs**

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example `set_params` for the `ticker.MaxNLocator` used by default for linear axes.

## Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

### Examples using `matplotlib.axes.Axes.locator_params`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_contourf\_demo.py
- *Constrained Layout Guide*
- *Tight Layout guide*

## 18.5.9 Units

<code>Axes.convert_xunits</code>	Convert $x$ using the unit type of the xaxis.
<code>Axes.convert_yunits</code>	Convert $y$ using the unit type of the yaxis.
<code>Axes.have_units</code>	Return whether units are set on any axis.

### matplotlib.axes.Axes.convert\_xunits

`Axes.convert_xunits(self, x)`  
Convert  $x$  using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units,  $x$  itself is returned.

### Examples using `matplotlib.axes.Axes.convert_xunits`

### matplotlib.axes.Axes.convert\_yunits

`Axes.convert_yunits(self, y)`  
Convert  $y$  using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units,  $y$  itself is returned.

### Examples using `matplotlib.axes.Axes.convert_yunits`

#### `matplotlib.axes.Axes.have_units`

`Axes.have_units(self)`

Return whether units are set on any axis.

### Examples using `matplotlib.axes.Axes.have_units`

#### 18.5.10 Adding artists

<code>Axes.add_artist</code>	Add an <i>Artist</i> to the axes, and return the artist.
<code>Axes.add_child_axes</code>	Add an <code>AxesBase</code> to the axes' children; return the child axes.
<code>Axes.add_collection</code>	Add a <i>Collection</i> to the axes' collections; return the collection.
<code>Axes.add_container</code>	Add a <i>Container</i> to the axes' containers; return the container.
<code>Axes.add_image</code>	Add an <code>AxesImage</code> to the axes' images; return the image.
<code>Axes.add_line</code>	Add a <code>Line2D</code> to the axes' lines; return the line.
<code>Axes.add_patch</code>	Add a <code>Patch</code> to the axes' patches; return the patch.
<code>Axes.add_table</code>	Add a <code>Table</code> to the axes' tables; return the table.

#### `matplotlib.axes.Axes.add_artist`

`Axes.add_artist(self, a)`

Add an *Artist* to the axes, and return the artist.

Use `add_artist` only for artists for which there is no dedicated "add" method; and if necessary, use a method such as `update_datalim` to manually update the dataLim if the artist is to be included in autoscaling.

If no `transform` has been specified when creating the artist (e.g. `artist.get_transform() == None`) then the transform is set to `ax.transData`.

## Examples using `matplotlib.axes.Axes.add_artist`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_scatter\_with\_legend.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_demo\_bboximage.py

- sphx\_glr\_gallery\_userdemo\_connect\_simple01.py
- sphx\_glr\_gallery\_userdemo\_simple\_annotate01.py
- sphx\_glr\_gallery\_userdemo\_simple\_legend02.py

## `matplotlib.axes.Axes.add_child_axes`

`Axes.add_child_axes(self, ax)`

Add an AxesBase to the axes' children; return the child axes.

This is the lowlevel version. See `axes.Axes.inset_axes`.

### Examples using `matplotlib.axes.Axes.add_child_axes`

#### `matplotlib.axes.Axes.add_collection`

`Axes.add_collection(self, collection, autolim=True)`

Add a `Collection` to the axes' collections; return the collection.

### Examples using `matplotlib.axes.Axes.add_collection`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_eventcollection\_demo.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_span\_regions.py
- sphx\_glr\_gallery\_statistics\_errorbars\_and\_boxes.py

- sphx\_glr\_gallery\_specialty\_plots\_mri\_with\_eeg.py
- sphx\_glr\_gallery\_units\_artist\_tests.py
- *Autoscaling*

#### `matplotlib.axes.Axes.add_container`

`Axes.add_container(self, container)`

Add a `Container` to the axes' containers; return the container.

### Examples using `matplotlib.axes.Axes.add_container`

#### `matplotlib.axes.Axes.add_image`

`Axes.add_image(self, image)`

Add an `AxesImage` to the axes' images; return the image.

## Examples using `matplotlib.axes.Axes.add_image`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_nonuniform.py

## matplotlib.axes.Axes.add\_line

`Axes.add_line(self, line)`

Add a `Line2D` to the axes' lines; return the line.

## Examples using `matplotlib.axes.Axes.add_line`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_line\_with\_text.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py
- sphx\_glr\_gallery\_units\_artist\_tests.py
- *Artist tutorial*

## matplotlib.axes.Axes.add\_patch

`Axes.add_patch(self, p)`

Add a `Patch` to the axes' patches; return the patch.

## Examples using `matplotlib.axes.Axes.add_patch`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_curve\_error\_band.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_demo.py

**matplotlib.axes.Axes.add\_table**`Axes.add_table(self, tab)`

Add a [Table](#) to the axes' tables; return the table.

**Examples using matplotlib.axes.Axes.add\_table****18.5.11 Twinning and sharing**

<code>Axes.twinx</code>	Create a twin Axes sharing the xaxis.
<code>Axes.twiny</code>	Create a twin Axes sharing the yaxis.
<code>Axes.sharex</code>	Share the x-axis with <i>other</i> .
<code>Axes.sharey</code>	Share the y-axis with <i>other</i> .
<code>Axes.get_shared_x_axes</code>	Return a reference to the shared axes Grouper object for x axes.
<code>Axes.get_shared_y_axes</code>	Return a reference to the shared axes Grouper object for y axes.

**matplotlib.axes.Axes.twinx**`Axes.twinx(self)`

Create a twin Axes sharing the xaxis.

Create a new Axes with an invisible x-axis and an independent y-axis positioned opposite to the original one (i.e. at right). The x-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both y-axes align, see [LinearLocator](#).

**Returns****Axes**

The newly created Axes instance

**Notes**

For those who are 'picking' artists while using `twinx`, pick events are only called for the artists in the top-most axes.

## Examples using `matplotlib.axes.Axes.twinx`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_box\_aspect.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_two\_scales.py
- sphx\_glr\_gallery\_axes\_grid1\_parasite\_simple.py
- sphx\_glr\_gallery\_axisartist\_demo\_parasite\_axes2.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_multiple\_yaxis\_with\_spines.py

## `matplotlib.axes.Axes.twiny`

`Axes.twiny(self)`

Create a twin Axes sharing the yaxis.

Create a new Axes with an invisible y-axis and an independent x-axis positioned opposite to the original one (i.e. at top). The y-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both x-axes align, see [LinearLocator](#).

### Returns

#### Axes

The newly created Axes instance

### Notes

For those who are 'picking' artists while using twiny, pick events are only called for the artists in the top-most axes.

## Examples using `matplotlib.axes.Axes.twiny`

## `matplotlib.axes.Axes.sharex`

`Axes.sharex(self, other)`

Share the x-axis with *other*.

This is equivalent to passing `sharex=other` when constructing the axes, and cannot be used if the x-axis is already being shared with another axes.

## Examples using `matplotlib.axes.Axes.sharex`

### `matplotlib.axes.Axes.sharey`

`Axes.sharey(self, other)`

Share the y-axis with `other`.

This is equivalent to passing `sharey=other` when constructing the axes, and cannot be used if the y-axis is already being shared with another axes.

## Examples using `matplotlib.axes.Axes.sharey`

### `matplotlib.axes.Axes.get_shared_x_axes`

`Axes.get_shared_x_axes(self)`

Return a reference to the shared axes Grouper object for x axes.

## Examples using `matplotlib.axes.Axes.get_shared_x_axes`

### `matplotlib.axes.Axes.get_shared_y_axes`

`Axes.get_shared_y_axes(self)`

Return a reference to the shared axes Grouper object for y axes.

## Examples using `matplotlib.axes.Axes.get_shared_y_axes`

### 18.5.12 Axes position

---

<code>Axes.get_anchor</code>	Get the anchor location.
<code>Axes.set_anchor</code>	Define the anchor location.
<code>Axes.get_axes_locator</code>	Return the axes_locator.
<code>Axes.set_axes_locator</code>	Set the axes locator.
<code>Axes.reset_position</code>	Reset the active position to the original position.
<code>Axes.get_position</code>	Get a copy of the axes rectangle as a <code>Bbox</code> .
<code>Axes.set_position</code>	Set the axes position.

---

## **`matplotlib.axes.Axes.get_anchor`**

`Axes.get_anchor(self)`

Get the anchor location.

See also:

`matplotlib.axes.Axes.set\_anchor`

for a description of the anchor.

`matplotlib.axes.Axes.set\_aspect`

for a description of aspect handling.

## **Examples using `matplotlib.axes.Axes.get_anchor`**

### **`matplotlib.axes.Axes.set_anchor`**

`Axes.set_anchor(self, anchor, share=False)`

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

#### **Parameters**

##### **anchor**

[2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:

- a sequence (*cx*, *cy*). *cx* and *cy* may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
- a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left
  - etc.

Here is an overview of the possible positions:

'NW'	'N'	'NE'
'W'	'C'	'E'
'SW'	'S'	'SE'

##### **share**

[bool, default: False] If True, apply the settings to all shared Axes.

See also:

`matplotlib.axes.Axes.set_aspect`

for a description of aspect handling.

### Examples using `matplotlib.axes.Axes.set_anchor`

#### `matplotlib.axes.Axes.get_axes_locator`

`Axes.get_axes_locator(self)`

Return the axes\_locator.

### Examples using `matplotlib.axes.Axes.get_axes_locator`

#### `matplotlib.axes.Axes.set_axes_locator`

`Axes.set_axes_locator(self, locator)`

Set the axes locator.

##### Parameters

###### `locator`

[Callable[[Axes, Renderer], Bbox]]

### Examples using `matplotlib.axes.Axes.set_axes_locator`

- sphx\_glr\_gallery\_axes\_grid1\_demo\_axes\_hbox\_divider.py

#### `matplotlib.axes.Axes.reset_position`

`Axes.reset_position(self)`

Reset the active position to the original position.

This resets the a possible position change due to aspect constraints. For an explanation of the positions see `set_position`.

### Examples using `matplotlib.axes.Axes.reset_position`

#### `matplotlib.axes.Axes.get_position`

`Axes.get_position(self, original=False)`

Get a copy of the axes rectangle as a `Bbox`.

##### Parameters

###### `original`

[bool] If `True`, return the original position. Otherwise return the active position.

For an explanation of the positions see [`set\_position`](#).

##### Returns

`Bbox`

### Examples using `matplotlib.axes.Axes.get_position`

- [sphx\\_glr\\_gallery\\_images\\_contours\\_and\\_fields\\_contour\\_demo.py](#)

#### `matplotlib.axes.Axes.set_position`

`Axes.set_position(self, pos, which='both')`

Set the axes position.

Axes have two position attributes. The 'original' position is the position allocated for the Axes. The 'active' position is the position the Axes is actually drawn at. These positions are usually the same unless a fixed aspect is set to the Axes. See [`Axes.set\_aspect`](#) for details.

##### Parameters

###### `pos`

[[left, bottom, width, height] or `Bbox`] The new position of the in `Figure` coordinates.

###### `which`

[{'both', 'active', 'original'}, default: 'both'] Determines which position variables to change.

See also:

[`matplotlib.transforms.Bbox.from\_bounds`](#)

[`matplotlib.transforms.Bbox.from\_extents`](#)

## Examples using `matplotlib.axes.Axes.set_position`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_contour\_demo.py

### 18.5.13 Async/event based

<code>Axes.stale</code>	Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
<code>Axes.pchanged</code>	Call all of the registered callbacks.
<code>Axes.add_callback</code>	Add a callback function that will be called whenever one of the <i>Artist</i> 's properties changes.
<code>Axes.remove_callback</code>	Remove a callback based on its observer id.

#### matplotlib.axes.Axes.stale

##### `property Axes.stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

#### matplotlib.axes.Axes.pchanged

##### `Axes.pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

## Examples using `matplotlib.axes.Axes.pchanged`

#### matplotlib.axes.Axes.add\_callback

##### `Axes.add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

##### Parameters

##### `func`

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

int

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

See also:

`remove_callback`

### Examples using `matplotlib.axes.Axes.add_callback`

#### `matplotlib.axes.Axes.remove_callback`

`Axes.remove_callback(self, oid)`

Remove a callback based on its observer id.

See also:

`add_callback`

### Examples using `matplotlib.axes.Axes.remove_callback`

## 18.5.14 Interactive

<code>Axes.can_pan</code>	Return whether this axes supports any pan/zoom button functionality.
<code>Axes.can_zoom</code>	Return whether this axes supports the zoom box button functionality.
<code>Axes.get_navigate</code>	Get whether the axes responds to navigation commands
<code>Axes.set_navigate</code>	Set whether the axes responds to navigation toolbar commands
<code>Axes.get_navigate_mode</code>	Get the navigation toolbar button status: 'PAN', 'ZOOM', or None
<code>Axes.set_navigate_mode</code>	Set the navigation toolbar button status;
<code>Axes.start_pan</code>	Called when a pan operation has started.
<code>Axes.drag_pan</code>	Called when the mouse moves during a pan operation.

continues on next page

Table 111 – continued from previous page

<code>Axes.end_pan</code>	Called when a pan operation completes (when the mouse button is up.)
<code>Axes.format_coord</code>	Return a format string formatting the <i>x</i> , <i>y</i> coordinates.
<code>Axes.format_cursor_data</code>	Return a string representation of <i>data</i> .
<code>Axes.format_xdata</code>	Return <i>x</i> formatted as an <i>x</i> -value.
<code>Axes.format_ydata</code>	Return <i>y</i> formatted as an <i>y</i> -value.
<code>Axes.mouseover</code>	If this property is set to <i>True</i> , the artist will be queried for custom context information when the mouse cursor moves over it.
<code>Axes.in_axes</code>	Return whether the given event (in display coords) is in the Axes.
<code>Axes.contains</code>	Test whether the artist contains the mouse event.
<code>Axes.contains_point</code>	Return whether <i>point</i> (pair of pixel coordinates) is inside the axes patch.
<code>Axes.get_cursor_data</code>	Return the cursor data for a given event.

**matplotlib.axes.Axes.can\_pan**`Axes.can_pan(self)`

Return whether this axes supports any pan/zoom button functionality.

**Examples using matplotlib.axes.Axes.can\_pan****matplotlib.axes.Axes.can\_zoom**`Axes.can_zoom(self)`

Return whether this axes supports the zoom box button functionality.

**Examples using matplotlib.axes.Axes.can\_zoom****matplotlib.axes.Axes.get\_navigate**`Axes.get_navigate(self)`

Get whether the axes responds to navigation commands

### Examples using `matplotlib.axes.Axes.get_navigate`

#### `matplotlib.axes.Axes.set_navigate`

`Axes.set_navigate(self, b)`

Set whether the axes responds to navigation toolbar commands

##### Parameters

**b**

[bool]

### Examples using `matplotlib.axes.Axes.set_navigate`

#### `matplotlib.axes.Axes.get_navigate_mode`

`Axes.get_navigate_mode(self)`

Get the navigation toolbar button status: 'PAN', 'ZOOM', or None

### Examples using `matplotlib.axes.Axes.get_navigate_mode`

#### `matplotlib.axes.Axes.set_navigate_mode`

`Axes.set_navigate_mode(self, b)`

Set the navigation toolbar button status;

**Warning:** this is not a user-API function.

### Examples using `matplotlib.axes.Axes.set_navigate_mode`

#### `matplotlib.axes.Axes.start_pan`

`Axes.start_pan(self, x, y, button)`

Called when a pan operation has started.

##### Parameters

**x, y**

[float] The mouse coordinates in display coords.

**button**

[`MouseButton`] The pressed mouse button.

## Notes

This is intended to be overridden by new projection types.

### Examples using `matplotlib.axes.Axes.start_pan`

#### `matplotlib.axes.Axes.drag_pan`

`Axes.drag_pan(self, button, key, x, y)`

Called when the mouse moves during a pan operation.

##### Parameters

###### `button`

[`MouseButton`] The pressed mouse button.

###### `key`

[str or None] The pressed key, if any.

###### `x, y`

[float] The mouse coordinates in display coords.

## Notes

This is intended to be overridden by new projection types.

### Examples using `matplotlib.axes.Axes.drag_pan`

#### `matplotlib.axes.Axes.end_pan`

`Axes.end_pan(self)`

Called when a pan operation completes (when the mouse button is up.)

## Notes

This is intended to be overridden by new projection types.

### Examples using `matplotlib.axes.Axes.end_pan`

#### `matplotlib.axes.Axes.format_coord`

`Axes.format_coord(self, x, y)`

Return a format string formatting the  $x, y$  coordinates.

### Examples using `matplotlib.axes.Axes.format_coord`

#### `matplotlib.axes.Axes.format_cursor_data`

`Axes.format_cursor_data(self, data)`

Return a string representation of  $data$ .

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

[`get\_cursor\_data`](#)

### Examples using `matplotlib.axes.Axes.format_cursor_data`

#### `matplotlib.axes.Axes.format_xdata`

`Axes.format_xdata(self, x)`

Return  $x$  formatted as an x-value.

This function will use the `fmt_xdata` attribute if it is not None, else will fall back on the xaxis major formatter.

### Examples using `matplotlib.axes.Axes.format_xdata`

#### `matplotlib.axes.Axes.format_ydata`

`Axes.format_ydata(self, y)`

Return  $y$  formatted as an y-value.

This function will use the `fmt_ydata` attribute if it is not None, else will fall back on the yaxis major formatter.

## Examples using `matplotlib.axes.Axes.format_ydata`

### `matplotlib.axes.Axes.mouseover`

#### `property Axes.mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

### `matplotlib.axes.Axes.in_axes`

#### `Axes.in_axes(self, mouseevent)`

Return whether the given event (in display coords) is in the Axes.

## Examples using `matplotlib.axes.Axes.in_axes`

### `matplotlib.axes.Axes.contains`

#### `Axes.contains(self, mouseevent)`

Test whether the artist contains the mouse event.

#### Parameters

##### `mouseevent`

[`matplotlib.backend_bases.MouseEvent`]

#### Returns

##### `contains`

[bool] Whether any values are within the radius.

##### `details`

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

### Examples using `matplotlib.axes.Axes.contains`

#### `matplotlib.axes.Axes.contains_point`

`Axes.contains_point(self, point)`

Return whether *point* (pair of pixel coordinates) is inside the axes patch.

### Examples using `matplotlib.axes.Axes.contains_point`

#### `matplotlib.axes.Axes.get_cursor_data`

`Axes.get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

#### Parameters

##### `event`

`[matplotlib.backend_bases.MouseEvent]`

See also:

`format_cursor_data`

### Examples using `matplotlib.axes.Axes.get_cursor_data`

## 18.5.15 Children

<code>Axes.get_children</code>	Return a list of the child <code>Artist</code> s of this <code>Artist</code> .
<code>Axes.get_images</code>	Return a list of <code>AxesImage</code> s contained by the Axes.
<code>Axes.get_lines</code>	Return a list of lines contained by the Axes.

continues on next page

Table 112 – continued from previous page

---

<code>Axes.findobj</code>	Find artist objects.
---------------------------	----------------------

---

**matplotlib.axes.Axes.get\_children**`Axes.get_children(self)`Return a list of the child *Artists* of this *Artist*.**Examples using `matplotlib.axes.Axes.get_children`****matplotlib.axes.Axes.get\_images**`Axes.get_images(self)`Return a list of *AxesImage*s contained by the Axes.**Examples using `matplotlib.axes.Axes.get_images`****matplotlib.axes.Axes.get\_lines**`Axes.get_lines(self)`

Return a list of lines contained by the Axes.

**Examples using `matplotlib.axes.Axes.get_lines`****matplotlib.axes.Axes.findobj**`Axes.findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.**Parameters****match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**[bool] Include *self* in the list to be checked for a match.

**Returns**

[list of \*Artist\*](#)

**Examples using `matplotlib.axes.Axes.findobj`****18.5.16 Drawing**

<code>Axes.draw</code>	Draw the Artist (and its children) using the given renderer.
<code>Axes.draw_artist</code>	Efficiently redraw a single artist.
<code>Axes.redraw_in_frame</code>	Efficiently redraw Axes data, but not axis ticks, labels, etc.
<code>Axes.get_renderer_cache</code>	
<code>Axes.get_rasterization_zorder</code>	Return the zorder value below which artists will be rasterized.
<code>Axes.set_rasterization_zorder</code>	Set the zorder threshold for rasterization for vector graphics output.
<code>Axes.get_window_extent</code>	Return the axes bounding box in display space; <i>args</i> and <i>kwags</i> are empty.
<code>Axes.get_tightbbox</code>	Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

**`matplotlib.axes.Axes.draw`**

`Axes.draw(self, renderer=None, inframe=<deprecated parameter>)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters****renderer**

[`RendererBase` subclass.]

**Notes**

This method is overridden in the Artist subclasses.

## Examples using `matplotlib.axes.Axes.draw`

### `matplotlib.axes.Axes.draw_artist`

`Axes.draw_artist(self, a)`

Efficiently redraw a single artist.

This method can only be used after an initial draw of the figure, because that creates and caches the renderer needed here.

## Examples using `matplotlib.axes.Axes.draw_artist`

- *Faster rendering by using blitting*

### `matplotlib.axes.Axes.redraw_in_frame`

`Axes.redraw_in_frame(self)`

Efficiently redraw Axes data, but not axis ticks, labels, etc.

This method can only be used after an initial draw which caches the renderer.

## Examples using `matplotlib.axes.Axes.redraw_in_frame`

### `matplotlib.axes.Axes.get_renderer_cache`

`Axes.get_renderer_cache(self)`

## Examples using `matplotlib.axes.Axes.get_renderer_cache`

### `matplotlib.axes.Axes.get_rasterization_zorder`

`Axes.get_rasterization_zorder(self)`

Return the zorder value below which artists will be rasterized.

## Examples using `matplotlib.axes.Axes.get_rasterization_zorder`

### `matplotlib.axes.Axes.set_rasterization_zorder`

`Axes.set_rasterization_zorder(self, z)`

Set the zorder threshold for rasterization for vector graphics output.

All artists with a zorder below the given value will be rasterized if they support rasterization.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

### Parameters

#### `z`

[float or None] The zorder below which artists are rasterized. If None rasterization based on zorder is deactivated.

## Examples using `matplotlib.axes.Axes.set_rasterization_zorder`

- sphx\_glr\_gallery\_misc\_rasterization\_demo.py

## `matplotlib.axes.Axes.get_window_extent`

`Axes.get_window_extent(self, *args, **kwargs)`

Return the axes bounding box in display space; `args` and `kwargs` are empty.

This bounding box does not include the spines, ticks, ticklables, or other labels. For a bounding box including these elements use `get_tightbbox`.

See also:

`matplotlib.axes.Axes.get_tightbbox`

`matplotlib.axis.Axis.get_tightbbox`

`matplotlib.spines.Spine.get_window_extent`

## Examples using `matplotlib.axes.Axes.get_window_extent`

## `matplotlib.axes.Axes.get_tightbbox`

`Axes.get_tightbbox(self, renderer, call_axes_locator=True, bbox_extra_artists=None, *, for_layout_only=False)`

Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

### Parameters

#### `renderer`

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### `bbox_extra_artists`

[list of `Artist` or None] List of artists to include in the tight bounding box. If None (default), then all artist children of the axes are included in the tight bounding box.

**call\_axes\_locator**

[bool, default: True] If *call\_axes\_locator* is False, it does not call the *\_axes\_locator* attribute, which is necessary to get the correct bounding box. *call\_axes\_locator=False* can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

**for\_layout\_only**

[default: False] The bounding box will *not* include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

**Returns*****BboxBase***

Bounding box in figure pixel coordinates.

**See also:**

[`matplotlib.axes.Axes.get\_window\_extent`](#)

[`matplotlib.axis.Axis.get\_tightbbox`](#)

[`matplotlib.spines.Spine.get\_window\_extent`](#)

**Examples using `matplotlib.axes.Axes.get_tightbbox`**

### 18.5.17 Projection

Methods used by *Axis* that must be overridden for non-rectilinear Axes.

---

***Axes.name******Axes.get\_xaxis\_transform***

Get the transformation used for drawing x-axis labels, ticks and gridlines.

***Axes.get\_yaxis\_transform***

Get the transformation used for drawing y-axis labels, ticks and gridlines.

***Axes.get\_data\_ratio***

Return the aspect ratio of the scaled data.

***Axes.get\_xaxis\_text1\_transform*****Returns**

---

***Axes.get\_xaxis\_text2\_transform*****Returns**

---

***Axes.get\_yaxis\_text1\_transform*****Returns**

---

continues on next page

Table 114 – continued from previous page

---

`Axes.get_yaxis_text2_transform`**Returns****matplotlib.axes.Axes.name**`Axes.name = 'rectilinear'`**matplotlib.axes.Axes.get\_xaxis\_transform**`Axes.get_xaxis_transform(self, which='grid')`

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

---

**Note:** This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

**Examples using `matplotlib.axes.Axes.get_xaxis_transform`**

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_fill\_between\_demo.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_vline\_hline\_demo.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_zoom\_effect.py
- sphx\_glr\_gallery\_statistics\_boxplot\_demo.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_angle\_annotation.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_centered\_spines\_with\_arrows.py
- *Transformations Tutorial*

**matplotlib.axes.Axes.get\_yaxis\_transform**`Axes.get_yaxis_transform(self, which='grid')`

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

---

**Note:** This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

## Examples using `matplotlib.axes.Axes.get_yaxis_transform`

- sphx\_glr\_gallery\_ticks\_and\_spines\_centered\_spines\_with\_arrows.py
- sphx\_glr\_gallery\_userdemo\_connect\_simple01.py
- [Transformations Tutorial](#)

## `matplotlib.axes.Axes.get_data_ratio`

`Axes.get_data_ratio(self)`

Return the aspect ratio of the scaled data.

### Notes

This method is intended to be overridden by new projection types.

## Examples using `matplotlib.axes.Axes.get_data_ratio`

## `matplotlib.axes.Axes.get_xaxis_text1_transform`

`Axes.get_xaxis_text1_transform(self, pad_points)`

### Returns

#### `transform`

[Transform] The transform used for drawing x-axis labels, which will add `pad_points` of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

#### `valign`

[{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

#### `halign`

[{'center', 'left', 'right'}] The text horizontal alignment.

### Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

## Examples using `matplotlib.axes.Axes.get_xaxis_text1_transform`

### `matplotlib.axes.Axes.get_xaxis_text2_transform`

`Axes.get_xaxis_text2_transform(self, pad_points)`

**Returns**

**transform**

[Transform] The transform used for drawing secondary x-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

**valign**

[{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign**

[{'center', 'left', 'right'}] The text horizontal alignment.

## Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

## Examples using `matplotlib.axes.Axes.get_xaxis_text2_transform`

### `matplotlib.axes.Axes.get_yaxis_text1_transform`

`Axes.get_yaxis_text1_transform(self, pad_points)`

**Returns**

**transform**

[Transform] The transform used for drawing y-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

**valign**

[{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign**

[{'center', 'left', 'right'}] The text horizontal alignment.

## Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

### Examples using `matplotlib.axes.Axes.get_yaxis_text1_transform`

#### `matplotlib.axes.Axes.get_yaxis_text2_transform`

`Axes.get_yaxis_text2_transform(self, pad_points)`

##### Returns

###### `transform`

[Transform] The transform used for drawing secondary y-axis labels, which will add `pad_points` of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

###### `valign`

[{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

###### `halign`

[{'center', 'left', 'right'}] The text horizontal alignment.

## Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

### Examples using `matplotlib.axes.Axes.get_yaxis_text2_transform`

## 18.5.18 Other

---

### `Axes.zorder`

`Axes.get_default_bbox_extra_artists` Return a default list of artists that are used for the bounding box calculation.

---

`Axes.get_transformed_clip_path_and_affine` Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

---

### `Axes.has_data`

Return whether any artists have been added to the axes.

---

### `matplotlib.axes.Axes.zorder`

`Axes.zorder = 0`

### `matplotlib.axes.Axes.get_default_bbox_extra_artists`

`Axes.get_default_bbox_extra_artists(self)`

Return a default list of artists that are used for the bounding box calculation.

Artists are excluded either by not being visible or `artist.set_in_layout(False)`.

### Examples using `matplotlib.axes.Axes.get_default_bbox_extra_artists`

### `matplotlib.axes.Axes.get_transformed_clip_path_and_affine`

`Axes.get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

### Examples using `matplotlib.axes.Axes.get_transformed_clip_path_and_affine`

### `matplotlib.axes.Axes.has_data`

`Axes.has_data(self)`

Return whether any artists have been added to the axes.

This should not be used to determine whether the `dataLim` need to be updated, and may not actually be useful for anything.

### Examples using `matplotlib.axes.Axes.has_data`

## 18.6 matplotlib.axis

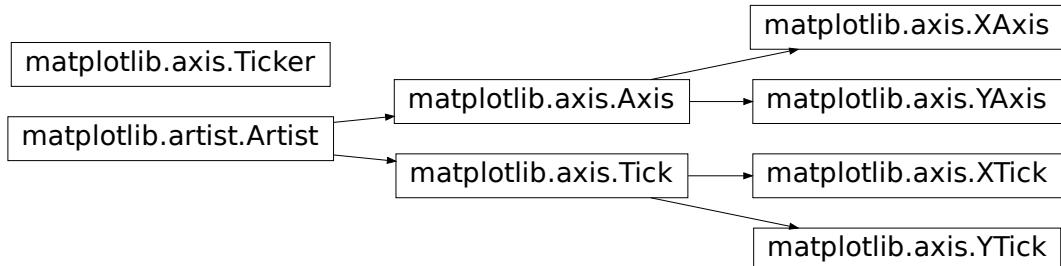

### Table of Contents

- *Inheritance*
- *Axis objects*
  - *Formatters and Locators*
  - *Axis Label*
  - *Ticks, tick labels and Offset text*

- *Data and view intervals*
- *Rendering helpers*
- *Interactive*
- *Units*
- *Incremental navigation*
- *XAxis Specific*
- *YAxis Specific*
- *Other*
- *Discouraged*
- *Tick objects*

Classes for the ticks and x and y axis.

### 18.6.1 Inheritance

### 18.6.2 Axis objects

**class** `matplotlib.axis.Axis`(*axes*, *pickradius*=15)  
Base class for `XAxis` and `YAxis`.

#### Attributes

**isDefault\_label**

[bool]

**axes**

[`matplotlib.axes.Axes`] The `Axes` instance the artist resides in, or `None`.

### major

[`matplotlib.axis.Ticker`] Determines the major tick positions and their label format.

### minor

[`matplotlib.axis.Ticker`] Determines the minor tick positions and their label format.

### callbacks

[`matplotlib.cbook.CallbackRegistry`]

### label

[`Text`] The axis label.

### labelpad

[float] The distance between the axis label and the tick labels. Defaults to `rcParams["axes.labelpad"]` (default: 4.0) = 4.

### offsetText

[`Text`] A `Text` object containing the data offset of the ticks (if any).

### pickradius

[float] The acceptance radius for containment tests. See also `Axis.contains`.

### majorTicks

[list of `Tick`] The major ticks.

### minorTicks

[list of `Tick`] The minor ticks.

## Parameters

### axes

[`matplotlib.axes.Axes`] The `Axes` to which the created Axis belongs.

### pickradius

[float] The acceptance radius for containment tests. See also `Axis.contains`.

**class** `matplotlib.axis.XAxis(*args, **kwargs)`

## Parameters

### axes

[`matplotlib.axes.Axes`] The `Axes` to which the created Axis belongs.

### pickradius

[float] The acceptance radius for containment tests. See also `Axis.contains`.

---

```
class matplotlib.axis.YAxis(*args, **kwargs)
```

### Parameters

#### axes

[*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

#### pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

```
class matplotlib.axis.Ticker
```

A container for the objects defining tick position and format.

### Attributes

#### locator

[*matplotlib.ticker.Locator* subclass] Determines the positions of the ticks.

#### formatter

[*matplotlib.ticker.Formatter* subclass] Determines the format of the tick labels.

---

<i>Axis.clear</i>	Clear the axis.
<i>Axis.cla</i>	[ <i>Deprecated</i> ] Clear this axis.
<i>Axis.get_scale</i>	Return this Axis' scale (as a str).

---

## matplotlib.axis.Axis.clear

```
Axis.clear(self)
```

Clear the axis.

This resets axis properties to their default values:

- the label
- the scale
- locators, formatters and ticks
- major and minor grid
- units
- registered callbacks

### Examples using `matplotlib.axis.Axis.clear`

#### `matplotlib.axis.Axis.cla`

`Axis.cla(self)`

[*Deprecated*] Clear this axis.

#### Notes

Deprecated since version 3.4.

### Examples using `matplotlib.axis.Axis.cla`

#### `matplotlib.axis.Axis.get_scale`

`Axis.get_scale(self)`

Return this Axis' scale (as a str).

### Examples using `matplotlib.axis.Axis.get_scale`

## Formatters and Locators

<code>Axis.get_major_formatter</code>	Get the formatter of the major ticker.
<code>Axis.get_major_locator</code>	Get the locator of the major ticker.
<code>Axis.get_minor_formatter</code>	Get the formatter of the minor ticker.
<code>Axis.get_minor_locator</code>	Get the locator of the minor ticker.
<code>Axis.set_major_formatter</code>	Set the formatter of the major ticker.
<code>Axis.set_major_locator</code>	Set the locator of the major ticker.
<code>Axis.set_minor_formatter</code>	Set the formatter of the minor ticker.
<code>Axis.set_minor_locator</code>	Set the locator of the minor ticker.
<code>Axis.remove_overlapping_locs</code>	If minor ticker locations that overlap with major ticker locations should be trimmed.
<code>Axis.get_remove_overlapping_locs</code>	
<code>Axis.set_remove_overlapping_locs</code>	

## `matplotlib.axis.Axis.get_major_formatter`

`Axis.get_major_formatter(self)`

Get the formatter of the major ticker.

### Examples using `matplotlib.axis.Axis.get_major_formatter`

## `matplotlib.axis.Axis.get_major_locator`

`Axis.get_major_locator(self)`

Get the locator of the major ticker.

### Examples using `matplotlib.axis.Axis.get_major_locator`

- sphx\_glr\_gallery\_axes\_grid1\_inset\_locator\_demo2.py

## `matplotlib.axis.Axis.get_minor_formatter`

`Axis.get_minor_formatter(self)`

Get the formatter of the minor ticker.

### Examples using `matplotlib.axis.Axis.get_minor_formatter`

## `matplotlib.axis.Axis.get_minor_locator`

`Axis.get_minor_locator(self)`

Get the locator of the minor ticker.

### Examples using `matplotlib.axis.Axis.get_minor_locator`

## `matplotlib.axis.Axis.set_major_formatter`

`Axis.set_major_formatter(self, formatter)`

Set the formatter of the major ticker.

In addition to a `Formatter` instance, this also accepts a `str` or function.

For a `str` a `StrMethodFormatter` is used. The field used for the value must be labeled '`x`' and the field used for the position must be labeled '`pos`'. See the `StrMethodFormatter` documentation for more information.

For a function, a [\*FuncFormatter\*](#) is used. The function must take two inputs (a tick value `x` and a position `pos`), and return a string containing the corresponding tick label. See the [\*FuncFormatter\*](#) documentation for more information.

### Parameters

#### formatter

[[\*Formatter\*](#), str, or function]

### Examples using `matplotlib.axis.Axis.set_major_formatter`

- [sphx\\_glr\\_gallery\\_lines\\_bars\\_and\\_markers\\_timeline.py](#)

## `matplotlib.axis.Axis.set_major_locator`

`Axis.set_major_locator(self, locator)`

Set the locator of the major ticker.

### Parameters

#### `locator`

[*Locator*]

## Examples using `matplotlib.axis.Axis.set_major_locator`

- [sphx\\_glr\\_gallery\\_lines\\_bars\\_and\\_markers\\_filled\\_step.py](#)

## `matplotlib.axis.Axis.set_minor_formatter`

`Axis.set_minor_formatter(self, formatter)`

Set the formatter of the minor ticker.

In addition to a `Formatter` instance, this also accepts a str or function. See `Axis.set_major_formatter` for more information.

### Parameters

#### `formatter`

[`Formatter`, str, or function]

## Examples using `matplotlib.axis.Axis.set_minor_formatter`

- sphx\_glr\_gallery\_showcase\_anatomy.py
- sphx\_glr\_gallery\_scales\_scales.py
- sphx\_glr\_gallery\_specialty\_plots\_skewt.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_centered\_ticklabels.py

## `matplotlib.axis.Axis.set_minor_locator`

`Axis.set_minor_locator(self, locator)`

Set the locator of the minor ticker.

### Parameters

#### `locator`

[`Locator`]

## Examples using `matplotlib.axis.Axis.set_minor_locator`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_secondary\_axis.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_date.py
- sphx\_glr\_gallery\_showcase\_anatomy.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_centered\_ticklabels.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_date\_demo\_convert.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_major\_minor\_demo.py

## `matplotlib.axis.Axis.remove_overlapping_locs`

### `property Axis.remove_overlapping_locs`

If minor ticker locations that overlap with major ticker locations should be trimmed.

## `matplotlib.axis.Axis.get_remove_overlapping_locs`

`Axis.get_remove_overlapping_locs(self)`

### Examples using `matplotlib.axis.Axis.get_remove_overlapping_locs`

## `matplotlib.axis.Axis.set_remove_overlapping_locs`

`Axis.set_remove_overlapping_locs(self, val)`

### Examples using `matplotlib.axis.Axis.set_remove_overlapping_locs`

## Axis Label

<code>Axis.set_label_coords</code>	Set the coordinates of the label.
<code>Axis.set_label_position</code>	Set the label position (top or bottom)
<code>Axis.set_label_text</code>	Set the text value of the axis label.
<code>Axis.get_label</code>	Return the axis label as a Text instance.
<code>Axis.get_label_position</code>	Return the label position (top or bottom)
<code>Axis.get_label_text</code>	Get the text of the label.

## `matplotlib.axis.Axis.set_label_coords`

`Axis.set_label_coords(self, x, y, transform=None)`

Set the coordinates of the label.

By default, the x coordinate of the y label and the y coordinate of the x label are determined by the tick label bounding boxes, but this can lead to poor alignment of multiple labels if there are multiple axes.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system: (0, 0) is bottom left, (0.5, 0.5) is center, etc.

## Examples using `matplotlib.axis.Axis.set_label_coords`

### `matplotlib.axis.Axis.set_label_position`

`Axis.set_label_position(self, position)`

Set the label position (top or bottom)

#### Parameters

##### `position`

[{'top', 'bottom'}]

## Examples using `matplotlib.axis.Axis.set_label_position`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_titles\_demo.py

### `matplotlib.axis.Axis.set_label_text`

`Axis.set_label_text(self, label, fontdict=None, **kwargs)`

Set the text value of the axis label.

#### Parameters

##### `label`

[str] Text string.

##### `fontdict`

[dict] Text properties.

##### `**kwargs`

Merged into fontdict.

## Examples using `matplotlib.axis.Axis.set_label_text`

### `matplotlib.axis.Axis.get_label`

`Axis.get_label(self)`

Return the axis label as a Text instance.

**Examples using `matplotlib.axis.Axis.get_label`**

- sphx\_glr\_gallery\_axes\_grid1\_parasite\_simple.py

**`matplotlib.axis.Axis.get_label_position`**

`Axis.get_label_position(self)`  
Return the label position (top or bottom)

**Examples using `matplotlib.axis.Axis.get_label_position`****`matplotlib.axis.Axis.get_label_text`**

`Axis.get_label_text(self)`  
Get the text of the label.

**Examples using `matplotlib.axis.Axis.get_label_text`****Ticks, tick labels and Offset text**

<code>Axis.get_major_ticks</code>	Return the list of major <i>Ticks</i> .
<code>Axis.get_majorticklabels</code>	Return this Axis' major tick labels, as a list of <i>Text</i> .
<code>Axis.get_majorticklines</code>	Return this Axis' major tick lines as a list of <i>Line2Ds</i> .
<code>Axis.get_majorticklocs</code>	Return this Axis' major tick locations in data coordinates.
<code>Axis.get_minor_ticks</code>	Return the list of minor <i>Ticks</i> .
<code>Axis.get_minorticklabels</code>	Return this Axis' minor tick labels, as a list of <i>Text</i> .
<code>Axis.get_minorticklines</code>	Return this Axis' minor tick lines as a list of <i>Line2Ds</i> .
<code>Axis.get_minorticklocs</code>	Return this Axis' minor tick locations in data coordinates.
<code>Axis.get_offset_text</code>	Return the axis offsetText as a <i>Text</i> instance.
<code>Axis.get_tick_padding</code>	
<code>Axis.get_ticklabels</code>	Get this Axis' tick labels.
<code>Axis.get_ticklines</code>	Return this Axis' tick lines as a list of <i>Line2Ds</i> .
<code>Axis.get_ticklocs</code>	Return this Axis' tick locations in data coordinates.
<code>Axis.get_gridlines</code>	Return this Axis' grid lines as a list of <i>Line2Ds</i> .
<code>Axis.grid</code>	Configure the grid lines.
<code>Axis.set_tick_params</code>	Set appearance parameters for ticks, ticklabels, and gridlines.

continues on next page

Table 119 – continued from previous page

<code>Axis.axis_date</code>	Set up axis ticks and labels to treat data along this Axis as dates.
-----------------------------	--

**matplotlib.axis.Axis.get\_major\_ticks**`Axis.get_major_ticks (self, numticks=None)`Return the list of major *Ticks*.**Examples using `matplotlib.axis.Axis.get_major_ticks`****matplotlib.axis.Axis.get\_majorticklabels**`Axis.get_majorticklabels (self)`Return this Axis' major tick labels, as a list of *Text*.**Examples using `matplotlib.axis.Axis.get_majorticklabels`**

- sphx\_glr\_gallery\_ticks\_and\_spines\_date\_precision\_and\_epochs.py

**matplotlib.axis.Axis.get\_majorticklines**`Axis.get_majorticklines (self)`Return this Axis' major tick lines as a list of *Line2Ds*.**Examples using `matplotlib.axis.Axis.get_majorticklines`****matplotlib.axis.Axis.get\_majorticklocs**`Axis.get_majorticklocs (self)`

Return this Axis' major tick locations in data coordinates.

**Examples using `matplotlib.axis.Axis.get_majorticklocs`****matplotlib.axis.Axis.get\_minor\_ticks**`Axis.get_minor_ticks (self, numticks=None)`Return the list of minor *Ticks*.

## Examples using `matplotlib.axis.Axis.get_minor_ticks`

- sphx\_glr\_gallery\_ticks\_and\_spines\_centered\_ticklabels.py

### `matplotlib.axis.Axis.get_minorticklabels`

`Axis.get_minorticklabels(self)`

Return this Axis' minor tick labels, as a list of `Text`.

## Examples using `matplotlib.axis.Axis.get_minorticklabels`

### `matplotlib.axis.Axis.get_minorticklines`

`Axis.get_minorticklines(self)`

Return this Axis' minor tick lines as a list of `Line2D`s.

## Examples using `matplotlib.axis.Axis.get_minorticklines`

### `matplotlib.axis.Axis.get_minorticklocs`

`Axis.get_minorticklocs(self)`

Return this Axis' minor tick locations in data coordinates.

## Examples using `matplotlib.axis.Axis.get_minorticklocs`

### `matplotlib.axis.Axis.get_offset_text`

`Axis.get_offset_text(self)`

Return the axis offsetText as a `Text` instance.

## Examples using `matplotlib.axis.Axis.get_offset_text`

### `matplotlib.axis.Axis.get_tick_padding`

`Axis.get_tick_padding(self)`

## Examples using `matplotlib.axis.Axis.get_tick_padding`

### `matplotlib.axis.Axis.get_ticklabels`

`Axis.get_ticklabels(self, minor=False, which=None)`

Get this Axis' tick labels.

#### Parameters

##### `minor`

[bool] Whether to return the minor or the major ticklabels.

##### `which`

[None, ('minor', 'major', 'both')] Overrides `minor`.

Selects which ticklabels to return

#### Returns

`list of Text`

#### Notes

The tick label strings are not populated until a `draw` method has been called.

See also: `draw` and `draw`.

## Examples using `matplotlib.axis.Axis.get_ticklabels`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_masked.py
- sphx\_glr\_gallery\_pyplots\_fig\_axes\_customize\_simple.py
- *Artist tutorial*

### `matplotlib.axis.Axis.get_ticklines`

`Axis.get_ticklines(self, minor=False)`

Return this Axis' tick lines as a list of `Line2D`s.

## Examples using `matplotlib.axis.Axis.get_ticklines`

- sphx\_glr\_gallery\_pyplots\_fig\_axes\_customize\_simple.py
- *Artist tutorial*

## `matplotlib.axis.Axis.get_ticklocs`

`Axis.get_ticklocs(self, *, minor=False)`

Return this Axis' tick locations in data coordinates.

## Examples using `matplotlib.axis.Axis.get_ticklocs`

- *Artist tutorial*

## `matplotlib.axis.Axis.get_gridlines`

`Axis.get_gridlines(self)`

Return this Axis' grid lines as a list of `Line2Ds`.

## Examples using `matplotlib.axis.Axis.get_gridlines`

## `matplotlib.axis.Axis.grid`

`Axis.grid(self, b=None, which='major', **kwargs)`

Configure the grid lines.

### Parameters

#### b

[bool or None] Whether to show the grid lines. If any `kwargs` are supplied, it is assumed you want the grid on and `b` will be set to True.

If `b` is `None` and there are no `kwargs`, this toggles the visibility of the lines.

#### which

[{'major', 'minor', 'both'}] The grid lines to apply the changes on.

#### \*\*kwargs

[`Line2D` properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

### Examples using `matplotlib.axis.Axis.grid`

- sphx\_glr\_gallery\_statistics\_boxplot\_color.py
- sphx\_glr\_gallery\_statistics\_boxplot\_demo.py
- sphx\_glr\_gallery\_statistics\_boxplot\_vs\_violin.py
- sphx\_glr\_gallery\_scales\_symlog\_demo.py

### `matplotlib.axis.Axis.set_tick_params`

`Axis.set_tick_params(self, which='major', reset=False, **kw)`

Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see [`matplotlib.axes.Axes.tick\_params\(\)`](#).

### Examples using `matplotlib.axis.Axis.set_tick_params`

- sphx\_glr\_gallery\_statistics\_customized\_violin.py
- sphx\_glr\_gallery\_pyplots\_dollar\_ticks.py
- sphx\_glr\_gallery\_axes\_grid1\_scatter\_hist\_locatable\_axes.py
- sphx\_glr\_gallery\_misc\_pythonic\_matplotlib.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_date\_demo\_rrule.py
- [Choosing Colormaps in Matplotlib](#)

### `matplotlib.axis.Axis.axis_date`

`Axis.axis_date(self, tz=None)`

Set up axis ticks and labels to treat data along this Axis as dates.

#### Parameters

`tz`

[str or `datetime.tzinfo`, default: `rcParams["timezone"]`] (default: 'UTC') The timezone used to create date labels.

## Examples using `matplotlib.axis.Axis.axis_date`

### Data and view intervals

<code>Axis.get_data_interval</code>	Return the Interval instance for this axis data limits.
<code>Axis.get_view_interval</code>	Return the view limits (min, max) of this axis.
<code>Axis.get_inverted</code>	Return whether this Axis is oriented in the "inverse" direction.
<code>Axis.set_data_interval</code>	Set the axis data limits.
<code>Axis.set_view_interval</code>	Set the axis view limits.
<code>Axis.set_inverted</code>	Set whether this Axis is oriented in the "inverse" direction.

### `matplotlib.axis.Axis.get_data_interval`

`Axis.get_data_interval(self)`

Return the Interval instance for this axis data limits.

## Examples using `matplotlib.axis.Axis.get_data_interval`

### `matplotlib.axis.Axis.get_view_interval`

`Axis.get_view_interval(self)`

Return the view limits (min, max) of this axis.

## Examples using `matplotlib.axis.Axis.get_view_interval`

### `matplotlib.axis.Axis.get_inverted`

`Axis.get_inverted(self)`

Return whether this Axis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

### Examples using `matplotlib.axis.Axis.get_inverted`

#### `matplotlib.axis.Axis.set_data_interval`

`Axis.set_data_interval(self, vmin, vmax, ignore=False)`

Set the axis data limits. This method is for internal use.

If *ignore* is False (the default), this method will never reduce the preexisting data limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the data limits will be set exactly to (*vmin*, *vmax*) in that order.

### Examples using `matplotlib.axis.Axis.set_data_interval`

#### `matplotlib.axis.Axis.set_view_interval`

`Axis.set_view_interval(self, vmin, vmax, ignore=False)`

Set the axis view limits. This method is for internal use; Matplotlib users should typically use e.g. `set_xlim` or `set_ylm`.

If *ignore* is False (the default), this method will never reduce the preexisting view limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the view limits will be set exactly to (*vmin*, *vmax*) in that order.

### Examples using `matplotlib.axis.Axis.set_view_interval`

#### `matplotlib.axis.Axis.set_inverted`

`Axis.set_inverted(self, inverted)`

Set whether this Axis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

### Examples using `matplotlib.axis.Axis.set_inverted`

#### Rendering helpers

---

`Axis.get_minpos`

`Axis.get_tick_space`

Return the estimated number of ticks that can fit on the axis.

continues on next page

Table 121 – continued from previous page

<code>Axis.get_ticklabel_extents</code>	Get the extents of the tick labels on either side of the axes.
<code>Axis.get_tightbbox</code>	Return a bounding box that encloses the axis.

**matplotlib.axis.Axis.get\_minpos**

`Axis.get_minpos(self)`

**Examples using `matplotlib.axis.Axis.get_minpos`****matplotlib.axis.Axis.get\_tick\_space**

`Axis.get_tick_space(self)`

Return the estimated number of ticks that can fit on the axis.

**Examples using `matplotlib.axis.Axis.get_tick_space`****matplotlib.axis.Axis.get\_ticklabel\_extents**

`Axis.get_ticklabel_extents(self, renderer)`

Get the extents of the tick labels on either side of the axes.

**Examples using `matplotlib.axis.Axis.get_ticklabel_extents`****matplotlib.axis.Axis.get\_tightbbox**

`Axis.get_tightbbox(self, renderer, *, for_layout_only=False)`

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

If `for_layout_only` is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained\_layout to ignore too-long labels when doing their layout.

## Examples using `matplotlib.axis.Axis.get_tightbbox`

### Interactive

<code>Axis.contains</code>	Test whether the artist contains the mouse event.
<code>Axis.get_pickradius</code>	Return the depth of the axis used by the picker.
<code>Axis.set_pickradius</code>	Set the depth of the axis used by the picker.

## matplotlib.axis.Axis.contains

`Axis.contains(self, mouseevent)`

Test whether the artist contains the mouse event.

### Parameters

#### mouseevent

[`matplotlib.backend_bases.MouseEvent`]

### Returns

#### contains

[bool] Whether any values are within the radius.

#### details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

## Examples using `matplotlib.axis.Axis.contains`

## matplotlib.axis.Axis.get\_pickradius

`Axis.get_pickradius(self)`

Return the depth of the axis used by the picker.

## Examples using `matplotlib.axis.Axis.get_pickradius`

### `matplotlib.axis.Axis.set_pickradius`

`Axis.set_pickradius(self, pickradius)`

Set the depth of the axis used by the picker.

#### Parameters

`pickradius`

[float]

## Examples using `matplotlib.axis.Axis.set_pickradius`

### Units

---

`Axis.convert_units`

---

`Axis.set_units`

Set the units for axis.

`Axis.get_units`

Return the units for axis.

`Axis.update_units`

Introspect *data* for units converter and update the  
axis.converter instance if necessary.

---

### `matplotlib.axis.Axis.convert_units`

`Axis.convert_units(self, x)`

## Examples using `matplotlib.axis.Axis.convert_units`

### `matplotlib.axis.Axis.set_units`

`Axis.set_units(self, u)`

Set the units for axis.

#### Parameters

`u`

[units tag]

## Notes

The units of any shared axis will also be updated.

### Examples using `matplotlib.axis.Axis.set_units`

- sphx\_glr\_gallery\_units\_artist\_tests.py
- sphx\_glr\_gallery\_units\_bar\_unit\_demo.py
- sphx\_glr\_gallery\_units\_units\_scatter.py

### `matplotlib.axis.Axis.get_units`

`Axis.get_units(self)`

Return the units for axis.

### Examples using `matplotlib.axis.Axis.get_units`

### `matplotlib.axis.Axis.update_units`

`Axis.update_units(self, data)`

Introspect *data* for units converter and update the axis.converter instance if necessary. Return *True* if *data* is registered for unit conversion.

### Examples using `matplotlib.axis.Axis.update_units`

#### Incremental navigation

<code>Axis.pan</code>	[Deprecated] Pan by <i>numsteps</i> (can be positive or negative).
<code>Axis.zoom</code>	[Deprecated] Zoom in/out on axis; if <i>direction</i> is >0 zoom in, else zoom out.

## matplotlib.axis.Axis.pan

`Axis.pan(self, numsteps)`

[*Deprecated*] Pan by *numsteps* (can be positive or negative).

### Notes

Deprecated since version 3.3.

## Examples using `matplotlib.axis.Axis.pan`

## matplotlib.axis.Axis.zoom

`Axis.zoom(self, direction)`

[*Deprecated*] Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out.

### Notes

Deprecated since version 3.3.

## Examples using `matplotlib.axis.Axis.zoom`

## XAxis Specific

<code>XAxis.axis_name</code>	Read-only name identifying the axis.
<code>XAxis.get_text_heights</code>	Return how much space should be reserved for text above and below the axes, as a pair of floats.
<code>XAxis.get_ticks_position</code>	Return the ticks position ("top", "bottom", "default", or "unknown").
<code>XAxis.set_ticks_position</code>	Set the ticks position.
<code>XAxis.tick_bottom</code>	Move ticks and ticklabels (if present) to the bottom of the axes.
<code>XAxis.tick_top</code>	Move ticks and ticklabels (if present) to the top of the axes.

### `matplotlib.axis.XAxis.axis_name`

```
XAxis.axis_name = 'x'
```

Read-only name identifying the axis.

### `matplotlib.axis.XAxis.get_text_heights`

```
XAxis.get_text_heights(self, renderer)
```

Return how much space should be reserved for text above and below the axes, as a pair of floats.

#### Examples using `matplotlib.axis.XAxis.get_text_heights`

### `matplotlib.axis.XAxis.get_ticks_position`

```
XAxis.get_ticks_position(self)
```

Return the ticks position ("top", "bottom", "default", or "unknown").

#### Examples using `matplotlib.axis.XAxis.get_ticks_position`

### `matplotlib.axis.XAxis.set_ticks_position`

```
XAxis.set_ticks_position(self, position)
```

Set the ticks position.

#### Parameters

##### `position`

[{'top', 'bottom', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at bottom. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

#### Examples using `matplotlib.axis.XAxis.set_ticks_position`

- sphx\_glr\_gallery\_statistics\_customized\_violin.py
- sphx\_glr\_gallery\_pyplots\_whats\_new\_99\_spines.py
- sphx\_glr\_gallery\_axes\_grid1\_demo\_colorbar\_with\_axes\_divider.py
- sphx\_glr\_gallery\_axes\_grid1\_demo\_colorbar\_with\_inset\_locator.py
- sphx\_glr\_gallery\_showcase\_integral.py
- sphx\_glr\_gallery\_showcase\_xkcd.py

- sphx\_glr\_gallery\_ticks\_and\_spines\_spine\_placement\_demo.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines\_bounds.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines\_dropped.py
- *Choosing Colormaps in Matplotlib*

## matplotlib.axis.XAxis.tick\_bottom

`XAxis.tick_bottom(self)`

Move ticks and ticklabels (if present) to the bottom of the axes.

### Examples using `matplotlib.axis.XAxis.tick_bottom`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_broken\_axis.py
- sphx\_glr\_gallery\_showcase\_bachelors\_degrees\_by\_gender.py

## matplotlib.axis.XAxis.tick\_top

`XAxis.tick_top(self)`

Move ticks and ticklabels (if present) to the top of the axes.

### Examples using `matplotlib.axis.XAxis.tick_top`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_broken\_axis.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_titles\_demo.py

## YAxis Specific

<code>YAxis.axis_name</code>	Read-only name identifying the axis.
<code>YAxis.get_text_widths</code>	
<code>YAxis.get_ticks_position</code>	Return the ticks position ("left", "right", "default", or "unknown").
<code>YAxis.set_offset_position</code>	<b>Parameters</b>
<code>YAxis.set_ticks_position</code>	Set the ticks position.
<code>YAxis.tick_left</code>	Move ticks and ticklabels (if present) to the left of the axes.

continues on next page

Table 126 – continued from previous page

---

<code>YAxis.tick_right</code>	Move ticks and ticklabels (if present) to the right of the axes.
-------------------------------	--

---

**matplotlib.axis.YAxis.axis\_name**`YAxis.axis_name = 'y'`

Read-only name identifying the axis.

**matplotlib.axis.YAxis.get\_text\_widths**`YAxis.get_text_widths(self, renderer)`**Examples using `matplotlib.axis.YAxis.get_text_widths`****matplotlib.axis.YAxis.get\_ticks\_position**`YAxis.get_ticks_position(self)`

Return the ticks position ("left", "right", "default", or "unknown").

**Examples using `matplotlib.axis.YAxis.get_ticks_position`****matplotlib.axis.YAxis.set\_offset\_position**`YAxis.set_offset_position(self, position)`**Parameters****position**`[{'left', 'right'}]`**Examples using `matplotlib.axis.YAxis.set_offset_position`****matplotlib.axis.YAxis.set\_ticks\_position**`YAxis.set_ticks_position(self, position)`

Set the ticks position.

**Parameters**

**position**

[{'left', 'right', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at left. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

**Examples using `matplotlib.axis.YAxis.set_ticks_position`**

- sphx\_glr\_gallery\_pyplots\_whats\_new\_99\_spines.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spine\_placement\_demo.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines\_bounds.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines\_dropped.py

**`matplotlib.axis.YAxis.tick_left`**`YAxis.tick_left(self)`

Move ticks and ticklabels (if present) to the left of the axes.

**Examples using `matplotlib.axis.YAxis.tick_left`**

- sphx\_glr\_gallery\_showcase\_bachelors\_degrees\_by\_gender.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_tick\_label\_right.py

**`matplotlib.axis.YAxis.tick_right`**`YAxis.tick_right(self)`

Move ticks and ticklabels (if present) to the right of the axes.

**Examples using `matplotlib.axis.YAxis.tick_right`****Other**`Axis.OFFSETTEXTPAD``Axis.axes`

The `Axes` instance the artist resides in, or `None`.

`Axis.limit_range_for_scale``Axis.reset_ticks`

Re-initialize the major and minor Tick lists.

continues on next page

Table 127 – continued from previous page

<code>Axis.set_default_intervals</code>	Set the default limits for the axis data and view interval if they have not been mutated yet.
---	---

### matplotlib.axis.Axis.OFFSETTEXTPAD

```
Axis.OFFSETTEXTPAD = 3
```

### matplotlib.axis.Axis.axes

**property** `Axis.axes`

The `Axes` instance the artist resides in, or `None`.

### matplotlib.axis.Axis.limit\_range\_for\_scale

```
Axis.limit_range_for_scale(self, vmin, vmax)
```

#### Examples using `matplotlib.axis.Axis.limit_range_for_scale`

### matplotlib.axis.Axis.reset\_ticks

```
Axis.reset_ticks(self)
```

Re-initialize the major and minor Tick lists.

Each list starts with a single fresh Tick.

#### Examples using `matplotlib.axis.Axis.reset_ticks`

### matplotlib.axis.Axis.set\_default\_intervals

```
Axis.set_default_intervals(self)
```

Set the default limits for the axis data and view interval if they have not been mutated yet.

#### Examples using `matplotlib.axis.Axis.set_default_intervals`

### Discouraged

These methods should be used together with care, calling `set_ticks` to specify the desired tick locations **before** calling `set_ticklabels` to specify a matching series of labels. Calling `set_ticks` makes a `FixedLocator`; its list of locations is then used by `set_ticklabels` to make an appropriate `Formatter`.

---

<code>Axis.set_ticks</code>	Set this Axis' tick locations.
<code>Axis.set_ticklabels</code>	Set the text values of the tick labels.

---

## matplotlib.axis.Axis.set\_ticks

`Axis.set_ticks(self, ticks, *, minor=False)`

Set this Axis' tick locations.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

### Parameters

#### ticks

[list of floats] List of tick locations.

#### minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

### Notes

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

## Examples using `matplotlib.axis.Axis.set_ticks`

- sphx\_glr\_gallery\_pyplots\_whats\_new\_99\_spines.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spine\_placement\_demo.py

## matplotlib.axis.Axis.set\_ticklabels

`Axis.set_ticklabels(self, ticklabels, *, minor=False, **kwargs)`

Set the text values of the tick labels.

**Warning:** This method should only be used after fixing the tick positions using `Axis.set_ticks`. Otherwise, the labels may end up in unexpected positions.

### Parameters

#### ticklabels

[sequence of str or of `Texts`] Texts for labeling each tick location in the sequence set by `Axis.set_ticks`; the number of labels must match the number of locations.

**minor**

[bool] If True, set minor ticks instead of major ticks.

**\*\*kwargs**

Text properties.

**Returns****list of `Texts`**

For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

**Examples using `matplotlib.axis.Axis.set_ticklabels`****18.6.3 Tick objects**

```
class matplotlib.axis.Tick(axes, loc, label=<deprecated parameter>, size=None,
                           width=None, color=None, tickdir=None, pad=None,
                           labelsize=None, labelcolor=None, zorder=None,
                           gridOn=None, tick1On=True, tick2On=True, label1On=True,
                           label2On=False, major=True, labelrotation=0,
                           grid_color=None, grid_linestyle=None,
                           grid_linewidth=None, grid_alpha=None, **kw)
```

Abstract base class for the axis ticks, grid lines and labels.

Ticks mark a position on an Axis. They contain two lines as markers and two labels; one each for the bottom and top positions (in case of an `XAxis`) or for the left and right positions (in case of a `YAxis`).

**Attributes****tick1line**

[`Line2D`] The left/bottom tick marker.

**tick2line**

[`Line2D`] The right/top tick marker.

**gridline**

[`Line2D`] The grid line associated with the label position.

**label1**

[`Text`] The left/bottom tick label.

**label2**

[[Text](#)] The right/top tick label.

bbox is the Bound2D bounding box in display coords of the Axes  
loc is the tick location in data coords  
size is the tick size in points

**class** `matplotlib.axis.XTick(*args, **kwargs)`

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes  
loc is the tick location in data coords  
size is the tick size in points

**class** `matplotlib.axis.YTick(*args, **kwargs)`

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes  
loc is the tick location in data coords  
size is the tick size in points

---

<code>Tick.apply_tickdir</code>	Set tick direction.
<code>Tick.get_loc</code>	Return the tick location (data coords) as a scalar.
<code>Tick.get_pad</code>	Get the value of the tick label pad in points.
<code>Tick.get_pad_pixels</code>	
<code>Tick.get_tick_padding</code>	Get the length of the tick outside of the axes.
<code>Tick.get_tickdir</code>	
<code>Tick.get_view_interval</code>	Return the view limits (min, max) of the axis the tick belongs to.
<code>Tick.set_label1</code>	Set the label1 text.
<code>Tick.set_label2</code>	Set the label2 text.
<code>Tick.set_pad</code>	Set the tick label pad in points
<code>Tick.update_position</code>	Set the location of tick in data coords with scalar loc.

---

**matplotlib.axis.Tick.apply\_tickdir**

`Tick.apply_tickdir(self, tickdir)`

Set tick direction. Valid values are 'out', 'in', 'inout'.

**Examples using matplotlib.axis.Tick.apply\_tickdir****matplotlib.axis.Tick.get\_loc**

`Tick.get_loc(self)`

Return the tick location (data coords) as a scalar.

### Examples using `matplotlib.axis.Tick.get_loc`

#### `matplotlib.axis.Tick.get_pad`

`Tick.get_pad(self)`

Get the value of the tick label pad in points.

### Examples using `matplotlib.axis.Tick.get_pad`

#### `matplotlib.axis.Tick.get_pad_pixels`

`Tick.get_pad_pixels(self)`

### Examples using `matplotlib.axis.Tick.get_pad_pixels`

#### `matplotlib.axis.Tick.get_tick_padding`

`Tick.get_tick_padding(self)`

Get the length of the tick outside of the axes.

### Examples using `matplotlib.axis.Tick.get_tick_padding`

#### `matplotlib.axis.Tick.get_tickdir`

`Tick.get_tickdir(self)`

### Examples using `matplotlib.axis.Tick.get_tickdir`

#### `matplotlib.axis.Tick.get_view_interval`

`Tick.get_view_interval(self)`

Return the view limits (min, max) of the axis the tick belongs to.

### Examples using `matplotlib.axis.Tick.get_view_interval`

#### `matplotlib.axis.Tick.set_label1`

`Tick.set_label1(self, s)`

Set the label1 text.

##### Parameters

s

[str]

### Examples using `matplotlib.axis.Tick.set_label1`

#### `matplotlib.axis.Tick.set_label2`

`Tick.set_label2(self, s)`

Set the label2 text.

##### Parameters

s

[str]

### Examples using `matplotlib.axis.Tick.set_label2`

#### `matplotlib.axis.Tick.set_pad`

`Tick.set_pad(self, val)`

Set the tick label pad in points

##### Parameters

val

[float]

### Examples using `matplotlib.axis.Tick.set_pad`

#### `matplotlib.axis.Tick.update_position`

`Tick.update_position(self, loc)`

Set the location of tick in data coords with scalar *loc*.

### Examples using `matplotlib.axis.Tick.update_position`

## 18.7 `matplotlib.backend_bases`

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a Matplotlib backend.

### **RendererBase**

An abstract base class to handle drawing/rendering operations.

### **FigureCanvasBase**

The abstraction layer that separates the [Figure](#) from the backend specific details like a user interface drawing area.

### **GraphicsContextBase**

An abstract base class that provides color, line styles, etc.

### **Event**

The base class for all of the Matplotlib event handling. Derived classes such as [KeyEvent](#) and [MouseEvent](#) store the meta data like keys and buttons pressed, x and y locations in pixel and [Axes](#) coordinates.

### **ShowBase**

The base class for the `Show` class of each interactive backend; the 'show' callable is then set to `Show.__call__`.

### **ToolContainerBase**

The base class for the Toolbar class of each interactive backend.

**class** `matplotlib.backend_bases.CloseEvent` (*name, canvas, guiEvent=None*)

Bases: `matplotlib.backend_bases.Event`

An event triggered by a figure being closed.

**class** `matplotlib.backend_bases.DrawEvent` (*name, canvas, renderer*)

Bases: `matplotlib.backend_bases.Event`

An event triggered by a draw operation on the canvas

In most backends callbacks subscribed to this callback will be fired after the rendering is complete but before the screen is updated. Any extra artists drawn to the canvas's renderer will be reflected without an explicit call to `blit`.

**Warning:** Calling `canvas.draw` and `canvas.blit` in these callbacks may not be safe with all backends and may cause infinite recursion.

In addition to the [Event](#) attributes, the following event attributes are defined:

#### **Attributes**

##### **renderer**

[[RendererBase](#)] The renderer for the draw event.

**class** `matplotlib.backend_bases.Event` (*name, canvas, guiEvent=None*)

Bases: `object`

A Matplotlib event. Attach additional attributes as defined in `FigureCanvasBase.mpl_connect()`. The following attributes are defined and shown with their default values

### Attributes

#### **name**

[str] The event name.

#### **canvas**

[`FigureCanvasBase`] The backend-specific canvas instance generating the event.

#### **guiEvent**

The GUI event that triggered the Matplotlib event.

**class** `matplotlib.backend_bases.FigureCanvasBase` (`figure=None`)

Bases: `object`

The canvas the figure renders into.

### Attributes

#### **figure**

[`matplotlib.figure.Figure`] A high-level figure instance.

**blit** (`self, bbox=None`)

Blit the canvas in bbox (default entire canvas).

**property button\_pick\_id**

**button\_press\_event** (`self, x, y, button, dblclick=False, guiEvent=None`)

Callback processing for mouse button press events.

Backend derived classes should call this function on any mouse button press. ( $x, y$ ) are the canvas coords ((0, 0) is lower left). button and key are as defined in `MouseEvent`.

This method will call all functions connected to the 'button\_press\_event' with a `MouseEvent` instance.

**button\_release\_event** (`self, x, y, button, guiEvent=None`)

Callback processing for mouse button release events.

Backend derived classes should call this function on any mouse button release.

This method will call all functions connected to the 'button\_release\_event' with a `MouseEvent` instance.

### Parameters

#### **x**

[float] The canvas coordinates where 0=left.

**y**

[float] The canvas coordinates where 0=bottom.

**guiEvent**

The native UI event that generated the Matplotlib event.

**property callbacks****close\_event** (*self*, *guiEvent=None*)

Pass a [CloseEvent](#) to all functions connected to *close\_event*.

**draw** (*self*, \**args*, \*\**kwparams*)

Render the [Figure](#).

It is important that this method actually walk the artist tree even if no output is produced because this will trigger deferred work (like computing limits auto-limits and tick values) that users may want access to before saving to disk.

**draw\_event** (*self*, *renderer*)

Pass a [DrawEvent](#) to all functions connected to *draw\_event*.

**draw\_idle** (*self*, \**args*, \*\**kwparams*)

Request a widget redraw once control returns to the GUI event loop.

Even if multiple calls to [draw\\_idle](#) occur before control returns to the GUI event loop, the figure will only be rendered once.

**Notes**

Backends may choose to override the method and implement their own strategy to prevent multiple renderings.

**enter\_notify\_event** (*self*, *guiEvent=None*, *xy=None*)

Callback processing for the mouse cursor entering the canvas.

Backend derived classes should call this function when entering canvas.

**Parameters****guiEvent**

The native UI event that generated the Matplotlib event.

**xy**

[(float, float)] The coordinate location of the pointer when the canvas is entered.

```
events = ['resize_event', 'draw_event', 'key_press_event', 'key_release_event',
filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint Photographic Experts Group JPEG Image',
fixed_dpi = None
```

**flush\_events(self)**

Flush the GUI events for the figure.

Interactive backends need to reimplement this method.

**get\_default\_filename(self)**

Return a string, which includes extension, suitable for use as a default filename.

**classmethod get\_default\_filetype()**

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

**classmethod get\_supported\_filetypes()**

Return dict of savefig file formats supported by this backend.

**classmethod get\_supported\_filetypes\_grouped()**

Return a dict of savefig file formats supported by this backend, where the keys are a file type name, such as 'Joint Photographic Experts Group', and the values are a list of filename extensions used for that filetype, such as ['jpg', 'jpeg'].

**get\_width\_height(self)**

Return the figure width and height in points or pixels (depending on the backend), truncated to integers.

**get\_window\_title(self)**

[*Deprecated*] Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

## Notes

Deprecated since version 3.4.

**grab\_mouse(self, ax)**

Set the child `Axes` which is grabbing the mouse events.

Usually called by the widgets themselves. It is an error to call this if the mouse is already grabbed by another axes.

**inaxes(self, xy)**

Return the topmost visible `Axes` containing the point `xy`.

## Parameters

**xy**

[(float, float)] (x, y) pixel positions from left/bottom of the canvas.

## Returns

**Axes or None**

The topmost visible axes containing the point, or None if no axes.

**is\_saving (self)**

Return whether the renderer is in the process of saving to a file, rather than rendering for an on-screen buffer.

**key\_press\_event (self, key, guiEvent=None)**

Pass a [KeyEvent](#) to all functions connected to key\_press\_event.

**key\_release\_event (self, key, guiEvent=None)**

Pass a [KeyEvent](#) to all functions connected to key\_release\_event.

**leave\_notify\_event (self, guiEvent=None)**

Callback processing for the mouse cursor leaving the canvas.

Backend derived classes should call this function when leaving canvas.

**Parameters****guiEvent**

The native UI event that generated the Matplotlib event.

**motion\_notify\_event (self, x, y, guiEvent=None)**

Callback processing for mouse movement events.

Backend derived classes should call this function on any motion-notify-event.

This method will call all functions connected to the 'motion\_notify\_event' with a [MouseEvent](#) instance.

**Parameters****x**

[float] The canvas coordinates where 0=left.

**y**

[float] The canvas coordinates where 0=bottom.

**guiEvent**

The native UI event that generated the Matplotlib event.

**mpl\_connect (self, s, func)**

Bind function *func* to event *s*.

**Parameters****s**

[str] One of the following events ids:

- 'button\_press\_event'
- 'button\_release\_event'

- 'draw\_event'
- 'key\_press\_event'
- 'key\_release\_event'
- 'motion\_notify\_event'
- 'pick\_event'
- 'resize\_event'
- 'scroll\_event'
- 'figure\_enter\_event',
- 'figure\_leave\_event',
- 'axes\_enter\_event',
- 'axes\_leave\_event'
- 'close\_event'.

**func**

[callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the `inaxes` attribute of the event will be set to the `Axes` the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See `KeyEvent` and `MouseEvent` for more info.

**Returns****cid**

A connection id that can be used with `FigureCanvasBase.mpl_disconnect`.

**Examples**

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

**mpl\_disconnect(self, cid)**

Disconnect the callback with id `cid`.

## Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

**new\_timer** (*self*, *interval=None*, *callbacks=None*)

Create a new backend-specific subclass of Timer.

This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

### Parameters

#### interval

[int] Timer interval in milliseconds.

#### callbacks

[list[tuple[callable, tuple, dict]]] Sequence of (func, args, kwargs) where func(\*args, \*\*kwargs) will be executed by the timer every *interval*.

Callbacks which return False or 0 will be removed from the timer.

## Examples

```
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1,), {'a': 3}))])
```

**pick** (*self*, *mouseevent*)

**pick\_event** (*self*, *mouseevent*, *artist*, *\*\*kwargs*)

Callback processing for pick events.

This method will be called by artists who are picked and will fire off *PickEvent* callbacks registered listeners.

Note that artists are not pickable by default (see *Artist.set\_picker*).

**print\_figure** (*self*, *filename*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *orientation='portrait'*, *format=None*, *\*, bbox\_inches=None*, *pad\_inches=None*, *bbox\_extra\_artists=None*, *backend=None*, *\*\*kwargs*)

Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you'll probably want to override this on hardcopy.

### Parameters

#### filename

[str or path-like or file-like] The file where the figure is saved.

**dpi**

[float, default: `rcParams["savefig.dpi"]` (default: 'figure')] The dots per inch to save the figure in.

**facecolor**

[color or 'auto', default: `rcParams["savefig.facecolor"]` (default: 'auto')] The facecolor of the figure. If 'auto', use the current figure facecolor.

**edgecolor**

[color or 'auto', default: `rcParams["savefig.edgecolor"]` (default: 'auto')] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

**orientation**

[{'landscape', 'portrait'}, default: 'portrait'] Only currently applies to PostScript printing.

**format**

[str, optional] Force a specific file format. If not given, the format is inferred from the *filename* extension, and if that fails from `rcParams["savefig.format"]` (default: 'png').

**bbox\_inches**

['tight' or *Bbox*, default: `rcParams["savefig.bbox"]` (default: None)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

**pad\_inches**

[float, default: `rcParams["savefig.pad_inches"]` (default: 0.1)] Amount of padding around the figure when *bbox\_inches* is 'tight'.

**bbox\_extra\_artists**

[list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**backend**

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

**release\_mouse (*self, ax*)**

Release the mouse grab held by the `Axes` *ax*.

Usually called by the widgets. It is ok to call this even if *ax* doesn't have the mouse grab currently.

**required\_interactive\_framework = None**

**resize**(*self*, *w*, *h*)

Set the canvas size in pixels.

**resize\_event**(*self*)

Pass a *ResizeEvent* to all functions connected to `resize_event`.

**scroll\_event**(*self*, *x*, *y*, *step*, *guiEvent=None*)

Callback processing for scroll events.

Backend derived classes should call this function on any scroll wheel event. (*x*, *y*) are the canvas coords ((0, 0) is lower left). button and key are as defined in *MouseEvent*.

This method will call all functions connected to the 'scroll\_event' with a *MouseEvent* instance.

**property scroll\_pick\_id****set\_window\_title**(*self*, *title*)

[*Deprecated*] Set the title text of the window containing the figure. Note that this has no effect if there is no window (e.g., a PS backend).

## Notes

Deprecated since version 3.4.

**start\_event\_loop**(*self*, *timeout=0*)

Start a blocking event loop.

Such an event loop is used by interactive functions, such as *ginput* and *waitforbutton-press*, to wait for events.

The event loop blocks until a callback function triggers *stop\_event\_loop*, or *timeout* is reached.

If *timeout* is 0 or negative, never timeout.

Only interactive backends need to reimplement this method and it relies on *flush\_events* being properly implemented.

Interactive backends should implement this in a more native way.

**stop\_event\_loop**(*self*)

Stop the current blocking event loop.

Interactive backends need to reimplement this to match *start\_event\_loop*

**supports\_blt = False****switch\_backends**(*self*, *FigureCanvasClass*)

Instantiate an instance of *FigureCanvasClass*

This is used for backend switching, e.g., to instantiate a *FigureCanvasPS* from a *FigureCanvas-GTK*. Note, deep copying is not done, so any changes to one of the instances (e.g., setting figure size or line props), will be reflected in the other

**class** `matplotlib.backend_bases.FigureManagerBase`(*canvas*, *num*)

Bases: `object`

A backend-independent abstraction of a figure container and controller.

The figure manager is used by pyplot to interact with the window in a backend-independent way. It's an adapter for the real (GUI) framework that represents the visual figure on screen.

GUI backends define from this class to translate common operations such as `show` or `resize` to the GUI-specific code. Non-GUI backends do not support these operations and can just use the base class.

The following basic operations are accessible:

### Window operations

- `show`
- `destroy`
- `full_screen_toggle`
- `resize`
- `get_window_title`
- `set_window_title`

### Key and mouse button press handling

The figure manager sets up default key and mouse button press handling by hooking up the `key_press_handler` to the matplotlib event system. This ensures the same shortcuts and mouse actions across backends.

### Other operations

Subclasses will have additional attributes and functions to access additional functionality. This is of course backend-specific. For example, most GUI backends have `window` and `toolbar` attributes that give access to the native GUI widgets of the respective framework.

#### Attributes

##### **canvas**

[`FigureCanvasBase`] The backend-specific canvas instance.

##### **num**

[int or str] The figure number.

##### **key\_press\_handler\_id**

[int] The default key handler cid, when using the toolmanager. To disable the default key press handling use:

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.key_press_handler_id)
```

##### **button\_press\_handler\_id**

[int] The default mouse button handler cid, when using the toolmanager. To disable the default button press handling use:

```
figure.canvas.mpl_disconnect(  
    figure.canvas.manager.button_press_handler_id)
```

### **button\_press** (*self, event*)

[*Deprecated*] The default Matplotlib button actions for extra mouse buttons.

### Notes

Deprecated since version 3.4.

### **destroy** (*self*)

### **full\_screen\_toggle** (*self*)

### **get\_window\_title** (*self*)

Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

### **key\_press** (*self, event*)

[*Deprecated*] Implement the default Matplotlib key bindings defined at [Navigation Keyboard Shortcuts](#).

### Notes

Deprecated since version 3.4.

### **resize** (*self, w, h*)

For GUI backends, resize the window (in pixels).

### **set\_window\_title** (*self, title*)

Set the title text of the window containing the figure.

This has no effect for non-GUI (e.g., PS) backends.

### **show** (*self*)

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in [Figure.show](#).

### **property statusbar**

## **class** matplotlib.backend\_bases.GraphicsContextBase

Bases: `object`

An abstract base class that provides color, line styles, etc.

### **copy\_properties** (*self, gc*)

Copy properties from *gc* to *self*.

### **get\_alpha** (*self*)

Return the alpha value used for blending - not supported on all backends.

**get\_antialiased(self)**

Return whether the object should try to do antialiased rendering.

**get\_capstyle(self)**

Return the *CapStyle*.

**get\_clip\_path(self)**

Return the clip path in the form (path, transform), where path is a *Path* instance, and transform is an affine transform to apply to the path before clipping.

**get\_clip\_rectangle(self)**

Return the clip rectangle as a *Bbox* instance.

**get\_dashes(self)**

Return the dash style as an (offset, dash-list) pair.

The dash list is a even-length list that gives the ink on, ink off in points. See p. 107 of to PostScript blue book for more info.

Default value is (None, None).

**get\_forced\_alpha(self)**

Return whether the value given by get\_alpha() should be used to override any other alpha-channel values.

**get\_gid(self)**

Return the object identifier if one is set, None otherwise.

**get\_hatch(self)**

Get the current hatch style.

**get\_hatch\_color(self)**

Get the hatch color.

**get\_hatch\_linewidth(self)**

Get the hatch linewidth.

**get\_hatch\_path(self, density=6.0)**

Return a *Path* for the current hatch.

**get\_joinstyle(self)**

Return the *JoinStyle*.

**get\_linewidth(self)**

Return the line width in points.

**get\_rgb(self)**

Return a tuple of three or four floats from 0-1.

**get\_sketch\_params(self)**

Return the sketch parameters for the artist.

**Returns**

**tuple or None**

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

### `get_snap(self)`

Return the snap setting, which can be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

### `get_url(self)`

Return a url if one is set, `None` otherwise.

### `restore(self)`

Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

### `set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

### `set_antialiased(self, b)`

Set whether object should be drawn with antialiased rendering.

### `set_capstyle(self, cs)`

Set how to draw endpoints of lines.

#### Parameters

##### `cs`

[`CapStyle` or {'butt', 'projecting', 'round'}]

### `set_clip_path(self, path)`

Set the clip path to a `TransformedPath` or `None`.

### `set_clip_rectangle(self, rectangle)`

Set the clip rectangle to a `Bbox` or `None`.

### `set_dashes(self, dash_offset, dash_list)`

Set the dash style for the gc.

#### Parameters

**dash\_offset**

[float or None] The offset (usually 0).

**dash\_list**

[array-like or None] The on-off sequence as points.

**Notes**

(None, None) specifies a solid line.

See p. 107 of to PostScript [blue book](#) for more info.

**set\_foreground(self, fg, isRGBA=False)**

Set the foreground color.

**Parameters****fg**

[color]

**isRGBA**

[bool] If *fg* is known to be an (r, g, b, a) tuple, *isRGBA* can be set to True to improve performance.

**set\_gid(self, id)**

Set the id.

**set\_hatch(self, hatch)**

Set the hatch style (for fills).

**set\_hatch\_color(self, hatch\_color)**

Set the hatch color.

**set\_joinstyle(self, js)**

Set how to draw connections between line segments.

**Parameters****js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_linewidth(self, w)**

Set the linewidth in points.

**set\_sketch\_params(self, scale=None, length=None, randomness=None)**

Set the sketch parameters.

**Parameters**

**scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, default: 128] The length of the wiggle along the line, in pixels.

**randomness**

[float, default: 16] The scale factor by which the length is shrunken or expanded.

**set\_snap (self, snap)**

Set the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

**set\_url (self, url)**

Set the url for links in compatible backends.

```
class matplotlib.backend_bases.KeyEvent(name, canvas, key, x=0, y=0,
                                         guiEvent=None)
```

Bases: `matplotlib.backend_bases.LocationEvent`

A key event (key press, key release).

Attach additional attributes as defined in `FigureCanvasBase mpl_connect ()`.

In addition to the `Event` and `LocationEvent` attributes, the following attributes are defined:

## Notes

Modifier keys will be prefixed to the pressed key and will be in the order "ctrl", "alt", "super". The exception to this rule is when the pressed key is itself a modifier key, therefore "ctrl+alt" and "alt+control" can both be valid key values.

## Examples

```
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

## Attributes

**key**

[None or str] the key(s) pressed. Could be **None**, a single case sensitive ascii character ("g", "G", "#", etc.), a special key ("control", "shift", "f1", "up", etc.) or a combination of the above (e.g., "ctrl+alt+g", "ctrl+alt+G").

(*x*, *y*) in figure coords ((0, 0) = bottom left).

```
class matplotlib.backend_bases.LocationEvent(name, canvas, x, y,  
    guiEvent=None)
```

Bases: *matplotlib.backend\_bases.Event*

An event that has a screen location.

The following additional attributes are defined and shown with their default values.

In addition to the *Event* attributes, the following event attributes are defined:

**Attributes****x**

[int] x position - pixels from left of canvas.

**y**

[int] y position - pixels from bottom of canvas.

**inaxes**

[*Axes* or None] The *Axes* instance over which the mouse is, if any.

**xdata**

[float or None] x data coordinate of the mouse.

**ydata**

[float or None] y data coordinate of the mouse.

(*x*, *y*) in figure coords ((0, 0) = bottom left).

**lastevent = None**

```
class matplotlib.backend_bases.MouseButton(value)
```

Bases: *enum.IntEnum*

An enumeration.

**BACK** = 8

**FORWARD** = 9

**LEFT** = 1

**MIDDLE** = 2

**RIGHT** = 3

```
class matplotlib.backend_bases.MouseEvent(name, canvas, x, y, button=None,
                                         key=None, step=0, dblclick=False,
                                         guiEvent=None)
Bases: matplotlib.backend_bases.LocationEvent
```

### A mouse event ('button\_press\_event',

'button\_release\_event', 'scroll\_event', 'motion\_notify\_event').

In addition to the [Event](#) and [LocationEvent](#) attributes, the following attributes are defined:

## Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)
```

## Attributes

### button

[None or [MouseButton](#) or {'up', 'down'}] The button pressed. 'up' and 'down' are used for scroll events. Note that LEFT and RIGHT actually refer to the "primary" and "secondary" buttons, i.e. if the user inverts their left and right buttons ("left-handed setting") then the LEFT button will be the one physically on the right.

### key

[None or str] The key pressed when the mouse event triggered, e.g. 'shift'. See [KeyEvent](#).

**Warning:** This key is currently obtained from the last 'key\_press\_event' or 'key\_release\_event' that occurred within the canvas. Thus, if the last change of keyboard state occurred while the canvas did not have focus, this attribute will be wrong.

### step

[float] The number of scroll steps (positive for 'up', negative for 'down'). This applies only to 'scroll\_event' and defaults to 0 otherwise.

### dblclick

[bool] Whether the event is a double-click. This applies only to 'button\_press\_event' and is False otherwise. In particular, it's not used in 'button\_release\_event'.

( $x, y$ ) in figure coords ((0, 0) = bottom left) button pressed None, 1, 2, 3, 'up', 'down'

```
class matplotlib.backend_bases.NavigationToolbar2(canvas)
Bases: object
```

Base class for the navigation cursor, version 2.

Backends must implement a canvas that handles connections for 'button\_press\_event' and 'button\_release\_event'. See [FigureCanvasBase.mpl\\_connect\(\)](#) for more information.

They must also define

**`save_figure()`**

save the current figure

**`set_cursor()`**

if you want the pointer icon to change

**`draw_rubberband() (optional)`**

draw the zoom to rect "rubberband" rectangle

**`set_message() (optional)`**

display message

**`set_history_buttons() (optional)`**

you can change the history back / forward buttons to indicate disabled / enabled state.

and override `__init__` to set up the toolbar -- without forgetting to call the base-class init. Typically, `__init__` needs to set up toolbar buttons connected to the `home`, `back`, `forward`, `pan`, `zoom`, and `save_figure` methods and using standard icons in the "images" subdirectory of the data path.

That's it, we'll do the rest!

**`back(self, *args)`**

Move back up the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

**`configure_subplots(self, *args)`**

**`drag_pan(self, event)`**

Callback for dragging in pan/zoom mode.

**`drag_zoom(self, event)`**

Callback for dragging in zoom mode.

**`draw(self)`**

[Deprecated] Redraw the canvases, update the locators.

## Notes

Deprecated since version 3.3.

**draw\_rubberband** (*self, event, x0, y0, x1, y1*)

Draw a rectangle rubberband to indicate zoom limits.

Note that it is not guaranteed that  $x0 \leq x1$  and  $y0 \leq y1$ .

**forward** (*self, \*args*)

Move forward in the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

**home** (*self, \*args*)

Restore the original view.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

**mouse\_move** (*self, event*)

**pan** (*self, \*args*)

Toggle the pan/zoom tool.

Pan with left button, zoom with right.

**press** (*self, event*)

[*Deprecated*] Called whenever a mouse button is pressed.

## Notes

Deprecated since version 3.3.

**press\_pan** (*self, event*)

Callback for mouse button press in pan/zoom mode.

**press\_zoom** (*self, event*)

Callback for mouse button press in zoom to rect mode.

**push\_current** (*self*)

Push the current view limits and position onto the stack.

**release** (*self, event*)

[*Deprecated*] Callback for mouse button release.

## Notes

Deprecated since version 3.3.

### `release_pan(self, event)`

Callback for mouse button release in pan/zoom mode.

### `release_zoom(self, event)`

Callback for mouse button release in zoom to rect mode.

### `remove_rubberband(self)`

Remove the rubberband.

### `save_figure(self, *args)`

Save the current figure.

### `set_cursor(self, cursor)`

Set the current cursor to one of the `Cursors` enums values.

If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

### `set_history_buttons(self)`

Enable or disable the back/forward button.

### `set_message(self, s)`

Display a message on toolbar or in status bar.

### `toolitems = (('Home', 'Reset original view', 'home', 'home'), ('Back', 'Back to previous view', 'back', 'back'), ('Forward', 'Forward to next view', 'forward', 'forward'))`

### `update(self)`

Reset the axes stack.

### `zoom(self, *args)`

Toggle zoom to rect mode.

## `exception matplotlib.backend_bases.NonGuiException`

Bases: `Exception`

Raised when trying show a figure in a non-GUI backend.

## `class matplotlib.backend_bases.PickEvent(name, canvas, mouseevent, artist, guiEvent=None, **kwargs)`

Bases: `matplotlib.backend_bases.Event`

A pick event, fired when the user picks a location on the canvas sufficiently close to an artist that has been made pickleable with `Artist.set_picker`.

Attrs: all the `Event` attributes plus

### Examples

Bind a function `on_pick()` to pick events, that prints the coordinates of the picked data point:

```
ax.plot(np.rand(100), 'o', picker=5)    # 5 points tolerance

def on_pick(event):
    line = event.artist
    xdata, ydata = line.get_data()
    ind = event.ind
    print('on pick line:', np.array([xdata[ind], ydata[ind]]).T)

cid = fig.canvas.mpl_connect('pick_event', on_pick)
```

### Attributes

#### mouseevent

[`MouseEvent`] The mouse event that generated the pick.

#### artist

[`matplotlib.artist.Artist`] The picked artist. Note that artists are not pickleable by default (see `Artist.set_picker`).

#### other

Additional attributes may be present depending on the type of the picked object; e.g., a `Line2D` pick may define different extra attributes than a `PatchCollection` pick.

**class** `matplotlib.backend_bases.RendererBase`

Bases: `object`

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing `draw_path()` alone would give a highly capable backend):

- `draw_path()`
- `draw_image()`
- `draw_gouraud_triangle()`

The following methods *should* be implemented in the backend for optimization reasons:

- `draw_text()`
- `draw_markers()`
- `draw_path_collection()`
- `draw_quad_mesh()`

**close\_group**(*self*, *s*)

Close a grouping element with label *s*.

Only used by the SVG renderer.

**draw\_gouraud\_triangle**(*self*, *gc*, *points*, *colors*, *transform*)

Draw a Gouraud-shaded triangle.

**Parameters****gc**

[*GraphicsContextBase*] The graphics context.

**points**

[(3, 2) array-like] Array of (x, y) points for the triangle.

**colors**

[(3, 4) array-like] RGBA colors for each point of the triangle.

**transform**

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

**draw\_gouraud\_triangles**(*self*, *gc*, *triangles\_array*, *colors\_array*, *transform*)

Draw a series of Gouraud triangles.

**Parameters****points**

[(N, 3, 2) array-like] Array of *N* (x, y) points for the triangles.

**colors**

[(N, 3, 4) array-like] Array of *N* RGBA colors for each point of the triangles.

**transform**

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

**draw\_image**(*self*, *gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

**Parameters****gc**

[*GraphicsContextBase*] A graphics context with clipping information.

**x**

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y**

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im**

[(N, M, 4) array-like of np.uint8] An array of RGBA pixels.

**transform**

[[matplotlib.transforms.Affine2DBase](#)] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an [Affine2DBase](#)) *may* be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

**draw\_markers (self, gc, marker\_path, marker\_trans, path, trans, rgbFace=None)**

Draw a marker at each of *path*'s vertices (excluding control points).

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters****gc**

[[GraphicsContextBase](#)] The graphics context.

**marker\_trans**

[[matplotlib.transforms.Transform](#)] An affine transform applied to the marker.

**trans**

[[matplotlib.transforms.Transform](#)] An affine transform applied to the path.

**draw\_path (self, gc, path, transform, rgbFace=None)**

Draw a [Path](#) instance using the given affine transform.

**draw\_path\_collection (self, gc, master\_transform, paths, all\_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset\_position)**

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

**draw\_quad\_mesh** (*self, gc, master\_transform, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, edgecolors*)

Fallback implementation of `draw_quad_mesh()` that generates paths and then calls `draw_path_collection()`.

**draw\_tex** (*self, gc, master\_transform, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, edgecolors*)

**draw\_text** (*self, gc, x, y, s, prop, angle, ismath=False, mtext=None*)

Draw the text instance.

## Parameters

**gc**

[*GraphicsContextBase*] The graphics context.

**x**

[float] The x location of the text in display coords.

**y**

[float] The y location of the text baseline in display coords.

**s**

[str] The text string.

**prop**

[*matplotlib.font\_manager.FontProperties*] The font properties.

**angle**

[float] The rotation angle in degrees anti-clockwise.

**mtext**

[*matplotlib.text.Text*] The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

#### `flipy(self)`

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

#### `get_canvas_width_height(self)`

Return the canvas width and height in display coords.

#### `get_image_magnification(self)`

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

#### `get_texmanager(self)`

Return the `TexManager` instance.

#### `get_text_width_height_descent(self, s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with `FontProperties prop`.

#### `new_gc(self)`

Return an instance of a `GraphicsContextBase`.

#### `open_group(self, s, gid=None)`

Open a grouping element with label `s` and `gid` (if set) as id.

Only used by the SVG renderer.

#### `option_image_nocomposite(self)`

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

#### `option_scale_image(self)`

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

#### `points_to_pixels(self, points)`

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

## Parameters

### **points**

[float or array-like] a float or a numpy array of float

## Returns

### Points converted to pixels

#### **start\_filter(self)**

Switch to a temporary renderer for image filtering effects.

Currently only supported by the agg renderer.

#### **start\_rasterizing(self)**

Switch to the raster renderer.

Used by [MixedModeRenderer](#).

#### **stop\_filter(self, filter\_func)**

Switch back to the original renderer. The contents of the temporary renderer is processed with the *filter\_func* and is drawn on the original renderer as an image.

Currently only supported by the agg renderer.

#### **stop\_rasterizing(self)**

Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.

Used by [MixedModeRenderer](#).

## **class matplotlib.backend\_bases.ResizeEvent(name, canvas)**

Bases: [matplotlib.backend\\_bases.Event](#)

An event triggered by a canvas resize

In addition to the *Event* attributes, the following event attributes are defined:

### Attributes

#### **width**

[int] Width of the canvas in pixels.

#### **height**

[int] Height of the canvas in pixels.

## **class matplotlib.backend\_bases.ShowBase**

Bases: [matplotlib.backend\\_bases.\\_Backend](#)

Simple base class to generate a `show()` function in backends.

Subclass must override `mainloop()` method.

```
class matplotlib.backend_bases.StatusbarBase(**kwargs)
Bases: object
```

[*Deprecated*] Base class for the statusbar.

### Notes

Deprecated since version 3.3.

```
set_message(self, s)
Display a message on toolbar or in status bar.
```

#### Parameters

**s**

[str] Message text.

```
class matplotlib.backend_bases.TimerBase(interval=None, callbacks=None)
Bases: object
```

A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

Subclasses must override the following methods:

- `_timer_start`: Backend-specific code for starting the timer.
- `_timer_stop`: Backend-specific code for stopping the timer.

Subclasses may additionally override the following methods:

- `_timer_set_single_shot`: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the `Timer` class itself will store the flag and the `_on_timer` method should be overridden to support such behavior.
- `_timer_set_interval`: Code for setting the interval on the timer, if there is a method for doing so on the timer object.
- `_on_timer`: The internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

#### Parameters

##### **interval**

[int, default: 1000ms] The time between timer events in milliseconds. Will be stored as `timer.interval`.

**callbacks**

[list[tuple[callable, tuple, dict]]] List of (func, args, kwargs) tuples that will be called upon timer events. This list is accessible as `timer.callbacks` and can be manipulated directly, or the functions `add_callback` and `remove_callback` can be used.

**`add_callback(self, func, *args, **kwargs)`**

Register `func` to be called by timer when the event fires. Any additional arguments provided will be passed to `func`.

This function returns `func`, which makes it possible to use it as a decorator.

**`property interval`**

The time between timer events, in milliseconds.

**`remove_callback(self, func, *args, **kwargs)`**

Remove `func` from list of callbacks.

`args` and `kwargs` are optional and used to distinguish between copies of the same function registered to be called with different arguments. This behavior is deprecated. In the future, `*args`, `**kwargs` won't be considered anymore; to keep a specific callback removable by itself, pass it to `add_callback` as a `functools.partial` object.

**`property single_shot`**

Whether this timer should stop after a single run.

**`start(self, interval=None)`**

Start the timer object.

**Parameters****`interval`**

[int, optional] Timer interval in milliseconds; overrides a previously set interval if provided.

**`stop(self)`**

Stop the timer.

**`class matplotlib.backend_bases.ToolContainerBase(toolmanager)`**

Bases: `object`

Base class for all tool containers, e.g. toolbars.

**Attributes****`toolmanager`**

[`ToolManager`] The tools with which this `ToolContainer` wants to communicate.

**`add_tool(self, tool, group, position=-1)`**

Add a tool to this container.

## Parameters

### tool

[tool\_like] The tool to add, see `ToolManager.get_tool`.

### group

[str] The name of the group to add this tool to.

### position

[int, default: -1] The position within the group to place this tool.

## `add_toolitem(self, name, group, position, image, description, toggle)`

Add a toolitem to the container.

This method must be implemented per backend.

The callback associated with the button click event, must be *exactly* `self.trigger_tool(name)`.

## Parameters

### name

[str] Name of the tool to add, this gets used as the tool's ID and as the default label of the buttons.

### group

[str] Name of the group that this tool belongs to.

### position

[int] Position of the tool within its group, if -1 it goes at the end.

### image

[str] Filename of the image for the button or `None`.

### description

[str] Description of the tool, used for the tooltips.

### toggle

[bool]

- `True` : The button is a toggle (change the pressed/unpressed state between consecutive clicks).
- `False` : The button is a normal button (returns to unpressed state after release).

## `remove_toolitem(self, name)`

Remove a toolitem from the ToolContainer.

This method must get implemented per backend.

Called when `ToolManager` emits a `tool_removed_event`.

### Parameters

#### `name`

[str] Name of the tool to remove.

### `set_message(self, s)`

Display a message on the toolbar.

### Parameters

#### `s`

[str] Message text.

### `toggle_toolitem(self, name, toggled)`

Toggle the toolitem without firing event.

### Parameters

#### `name`

[str] Id of the tool to toggle.

#### `toggled`

[bool] Whether to set this tool as toggled or not.

### `trigger_tool(self, name)`

Trigger the tool.

### Parameters

#### `name`

[str] Name (id) of the tool triggered from within the container.

`matplotlib.backend_bases.button_press_handler(event, canvas=None, toolbar=None)`

The default Matplotlib button actions for extra mouse buttons.

Parameters are as for `key_press_handler`, except that `event` is a `MouseEvent`.

`matplotlib.backend_bases.get_registered_canvas_class(format)`

Return the registered default canvas for given file format. Handles deferred import of required backend.

`matplotlib.backend_bases.key_press_handler(event, canvas=None, toolbar=None)`

Implement the default Matplotlib key bindings for the canvas and toolbar described at [Navigation Keyboard Shortcuts](#).

### Parameters

### event

[*KeyEvent*] A key press/release event.

### canvas

[*FigureCanvasBase*, default: `event.canvas`] The backend-specific canvas instance. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas`.

### toolbar

[*NavigationToolbar2*, default: `event.canvas.toolbar`] The navigation cursor toolbar. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas.toolbar`.

`matplotlib.backend_bases.register_backend(format, backend, description=None)`  
Register a backend for saving to a given file format.

#### Parameters

##### format

[str] File extension

##### backend

[module string or canvas class] Backend for handling file output

##### description

[str, default: ""] Description of the file type.

## 18.8 `matplotlib.backend_managers`

`class matplotlib.backend_managers.ToolEvent(name, sender, tool, data=None)`  
Bases: `object`

Event for tool manipulation (add/remove).

`class matplotlib.backend_managers.ToolManager(figsize=None)`  
Bases: `object`

Manager for actions triggered by user interactions (key press, toolbar clicks, ...) on a Figure.

#### Attributes

##### `figure`

[*Figure*] Figure that holds the canvas.

##### `keypresslock`

[*LockDraw*] `LockDraw` object to know if the `canvas` key\_press\_event is locked.

**messagelock**

[*LockDraw*] *LockDraw* object to know if the message is available to write.

**property active\_toggle**

Currently toggled tools.

**add\_tool (self, name, tool, \*args, \*\*kwargs)**

Add tool to *ToolManager*.

If successful, adds a new event `tool_trigger_{name}` where `{name}` is the *name* of the tool; the event is fired every time the tool is triggered.

**Parameters****name**

[str] Name of the tool, treated as the ID, has to be unique.

**tool**

[class\_like, i.e. str or type] Reference to find the class of the Tool to added.

**See also:****`matplotlib.backend_tools.ToolBase`**

The base class for tools.

**Notes**

args and kwargs get passed directly to the tools constructor.

**property canvas**

Canvas managed by FigureManager.

**property figure**

Figure that holds the canvas.

**get\_tool (self, name, warn=True)**

Return the tool object with the given name.

For convenience, this passes tool objects through.

**Parameters****name**

[str or *ToolBase*] Name of the tool, or the tool itself.

**warn**

[bool, default: True] Whether a warning should be emitted if no tool with the given name exists.

**Returns**

*ToolBase* or *None*

The tool or *None* if no tool with the given name exists.

**get\_tool\_keymap** (*self*, *name*)

Return the keymap associated with the specified tool.

**Parameters**

**name**

[str] Name of the Tool.

**Returns**

**list of str**

List of keys associated with the tool.

**message\_event** (*self*, *message*, *sender=None*)

Emit a *ToolManagerMessageEvent*.

**remove\_tool** (*self*, *name*)

Remove tool named *name*.

**Parameters**

**name**

[str] Name of the tool.

**set\_figure** (*self*, *figure*, *update\_tools=True*)

Bind the given figure to the tools.

**Parameters**

**figure**

[*Figure*]

**update\_tools**

[bool, default: True] Force tools to update figure.

**toolmanager\_connect** (*self*, *s*, *func*)

Connect event with string *s* to *func*.

**Parameters**

**s**

[str] The name of the event. The following events are recognized:

- 'tool\_message\_event'
- 'tool\_removed\_event'
- 'tool\_added\_event'

For every tool added a new event is created

- 'tool\_trigger\_TOOLNAME', where TOOLNAME is the id of the tool.

#### func

[callable] Callback function for the toolmanager event with signature:

```
def func(event: ToolEvent) -> Any
```

#### Returns

#### cid

The callback id for the connection. This can be used in `toolmanager_disconnect`.

#### toolmanager\_disconnect (self, cid)

Disconnect callback id `cid`.

Example usage:

```
cid = toolmanager.toolmanager_connect('tool_trigger_zoom', onpress)
#...later
toolmanager.toolmanager_disconnect(cid)
```

#### property tools

A dict mapping tool name -> controlled tool.

#### trigger\_tool (self, name, sender=None, canvasevent=None, data=None)

Trigger a tool and emit the `tool_trigger_{name}` event.

#### Parameters

##### name

[str] Name of the tool.

##### sender

[object] Object that wishes to trigger the tool.

##### canvasevent

[Event] Original Canvas event or None.

##### data

[object] Extra data to pass to the tool when triggering.

**update\_keymap** (*self, name, key, \*args*)  
Set the keymap to associate with the specified tool.

### Parameters

#### **name**

[str] Name of the Tool.

#### **key**

[str or list of str] Keys to associate with the tool.

**class** `matplotlib.backend_managers.ToolManagerMessageEvent` (*name, sender, message*)  
Bases: `object`

Event carrying messages from toolmanager.

Messages usually get displayed to the user by the toolbar.

**class** `matplotlib.backend_managers.ToolTriggerEvent` (*name, sender, tool, canvasevent=None, data=None*)  
Bases: `matplotlib.backend_managers.ToolEvent`

Event to inform that a tool has been triggered.

## 18.9 `matplotlib.backend_tools`

Abstract base classes define the primitives for Tools. These tools are used by `matplotlib.backend_managers.ToolManager`

### `ToolBase`

Simple stateless tool

### `ToolToggleBase`

Tool that has two states, only one Toggle tool can be active at any given time for the same `matplotlib.backend_managers.ToolManager`

**class** `matplotlib.backend_tools.AxisScaleBase` (\**args, \*\*kwargs*)  
Bases: `matplotlib.backend_tools.ToolToggleBase`

Base Tool to toggle between linear and logarithmic.

#### `disable` (*self, event*)

Disable the toggle tool.

`trigger` call this method when toggled is True.

This can happen in different circumstances.

- Click on the toolbar tool button.

- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`.
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`).

`enable(self, event)`

Enable the toggle tool.

`trigger` calls this method when `toggled` is False.

`trigger(self, sender, event, data=None)`

Calls `enable` or `disable` based on `toggled` value.

**class** `matplotlib.backend_tools.ConfigureSubplotsBase(toolmanager, name)`

Bases: `matplotlib.backend_tools.ToolBase`

Base tool for the configuration of subplots.

`description = 'Configure subplots'`

`image = 'subplots'`

**class** `matplotlib.backend_tools.Cursors(value)`

Bases: `enum.IntEnum`

Backend-independent cursor types.

`HAND = 0`

`MOVE = 3`

`POINTER = 1`

`SELECT_REGION = 2`

`WAIT = 4`

**class** `matplotlib.backend_tools.RubberbandBase(toolmanager, name)`

Bases: `matplotlib.backend_tools.ToolBase`

Draw and remove a rubberband.

`draw_rubberband(self, *data)`

Draw rubberband.

This method must get implemented per backend.

`remove_rubberband(self)`

Remove rubberband.

This method should get implemented per backend.

`trigger(self, sender, event, data)`

Call `draw_rubberband` or `remove_rubberband` based on data.

**class** `matplotlib.backend_tools.SaveFigureBase(toolmanager, name)`

Bases: `matplotlib.backend_tools.ToolBase`

Base tool for figure saving.

`default_keymap = ['s', 'ctrl+s']`

```
description = 'Save the figure'
image = 'filesave'

class matplotlib.backend_tools.SetCursorBase(*args, **kwargs)
Bases: matplotlib.backend_tools.ToolBase

    Change to the current cursor while in axes.

    This tool, keeps track of all ToolToggleBase derived tools, and calls set_cursor when a tool
    gets triggered.
```

```
set_cursor(self, cursor)
    Set the cursor.

    This method has to be implemented per backend.
```

```
set_figure(self, figure)
    Assign a figure to the tool.
```

### Parameters

**figure**  
[*Figure*]

```
class matplotlib.backend_tools.ToolBack(toolmanager, name)
Bases: matplotlib.backend_tools.ViewsPositionsBase

    Move back up the view limits stack.

    default_keymap = ['left', 'c', 'backspace', 'MouseButton.BACK']
    description = 'Back to previous view'
    image = 'back'
```

```
class matplotlib.backend_tools.ToolBase(toolmanager, name)
Bases: object
```

Base tool class.

A base tool, only implements *trigger* method or not method at all. The tool is instantiated by *matplotlib.backend\_managers.ToolManager*.

### Attributes

**toolmanager**  
[*matplotlib.backend\_managers.ToolManager*] ToolManager that  
controls this Tool.

**figure**  
[*FigureCanvas*] Figure instance that is affected by this Tool.

**name**  
[str] Tool Id.

**property** canvas**default\_keymap = None**

Keymap to associate with this tool.

**String:** List of comma separated keys that will be used to call this tool when the keypress event of self.figure.canvas is emitted.

**description = None**

Description of the Tool.

**String:** If the Tool is included in the Toolbar this text is used as a Tooltip.

**destroy(self)**

Destroy the tool.

This method is called when the tool is removed by `matplotlib.backend_managers.ToolManager.remove_tool`.

**property** figure**image = None**

Filename of the image.

**String:** Filename of the image to use in the toolbar. If None, the *name* is used as a label in the toolbar button.

**property** name

Tool Id.

**set\_figure(self, figure)**

Assign a figure to the tool.

**Parameters****figure**

[*Figure*]

**property** toolmanager**trigger(self, sender, event, data=None)**

Called when this tool gets used.

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`.

**Parameters****event**

[*Event*] The canvas event that caused this tool to be called.

**sender**

[object] Object that requested the tool to be triggered.

**data**

[object] Extra data.

```
class matplotlib.backend_tools.ToolCopyToClipboardBase(toolmanager,
                                                       name)
Bases: matplotlib.backend_tools.ToolBase
Tool to copy the figure to the clipboard.

default_keymap = ['ctrl+c', 'cmd+c']
description = 'Copy the canvas figure to clipboard'
trigger(self, *args, **kwargs)
    Called when this tool gets used.

    This method is called by matplotlib.backend_managers.ToolManager.
    trigger_tool.
```

**Parameters****event**

[Event] The canvas event that caused this tool to be called.

**sender**

[object] Object that requested the tool to be triggered.

**data**

[object] Extra data.

```
class matplotlib.backend_tools.ToolCursorPosition(*args, **kwargs)
```

Bases: matplotlib.backend\_tools.ToolBase

Send message with the current pointer position.

This tool runs in the background reporting the position of the cursor.

**send\_message**(self, event)

Call `matplotlib.backend_managers.ToolManager.message_event`.

**set\_figure**(self, figure)

Assign a figure to the tool.

**Parameters****figure**

[Figure]

```
class matplotlib.backend_tools.ToolEnableAllNavigation(**kwargs)
```

Bases: matplotlib.backend\_tools.\_ToolEnableAllNavigation

[Deprecated]

## Notes

Deprecated since version 3.3:

```
class matplotlib.backend_tools.ToolEnableNavigation(**kwargs)
Bases: matplotlib.backend_tools._ToolEnableNavigation
```

[*Deprecated*]

## Notes

Deprecated since version 3.3:

```
class matplotlib.backend_tools.ToolForward(toolmanager, name)
Bases: matplotlib.backend_tools.ViewsPositionsBase
```

Move forward in the view lim stack.

```
default_keymap = ['right', 'v', MouseButton.FORWARD']
description = 'Forward to next view'
image = 'forward'
```

```
class matplotlib.backend_tools.ToolFullScreen(*args, **kwargs)
Bases: matplotlib.backend_tools.ToolToggleBase
```

Tool to toggle full screen.

```
default_keymap = ['f', 'ctrl+f']
description = 'Toggle fullscreen mode'
disable(self, event)
```

Disable the toggle tool.

trigger call this method when toggled is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`.
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`).

```
enable(self, event)
Enable the toggle tool.
```

trigger calls this method when toggled is False.

```
class matplotlib.backend_tools.ToolGrid(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase
```

Tool to toggle the major grids of the figure.

```
default_keymap = ['g']
```

```
description = 'Toggle major grids'

trigger(self, sender, event, data=None)
    Called when this tool gets used.

    This method is called by matplotlib.backend_managers.ToolManager.
    trigger_tool.
```

### Parameters

#### event

[Event] The canvas event that caused this tool to be called.

#### sender

[object] Object that requested the tool to be triggered.

#### data

[object] Extra data.

```
class matplotlib.backend_tools.ToolHelpBase(toolmanager, name)
```

Bases: [matplotlib.backend\\_tools.ToolBase](#)

```
default_keymap = ['f1']
```

```
description = 'Print tool list, shortcuts and description'
```

```
static format_shortcut(key_sequence)
```

Converts a shortcut string from the notation used in rc config to the standard notation for displaying shortcuts, e.g. 'ctrl+a' -> 'Ctrl+A'.

```
image = 'help'
```

```
class matplotlib.backend_tools.ToolHome(toolmanager, name)
```

Bases: [matplotlib.backend\\_tools.ViewsPositionsBase](#)

Restore the original view limits.

```
default_keymap = ['h', 'r', 'home']
```

```
description = 'Reset original view'
```

```
image = 'home'
```

```
class matplotlib.backend_tools.ToolMinorGrid(toolmanager, name)
```

Bases: [matplotlib.backend\\_tools.ToolBase](#)

Tool to toggle the major and minor grids of the figure.

```
default_keymap = ['G']
```

```
description = 'Toggle major and minor grids'
```

```
trigger(self, sender, event, data=None)
```

Called when this tool gets used.

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`.

### Parameters

#### `event`

[`Event`] The canvas event that caused this tool to be called.

#### `sender`

[object] Object that requested the tool to be triggered.

#### `data`

[object] Extra data.

```
class matplotlib.backend_tools.ToolPan(*args)
Bases: matplotlib.backend_tools.ZoomPanBase

Pan axes with left mouse, zoom with right.

cursor = 3
default_keymap = ['p']
description = 'Pan axes with left mouse, zoom with right'
image = 'move'
radio_group = 'default'

class matplotlib.backend_tools.ToolQuit(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase

Tool to call the figure manager destroy method.

default_keymap = ['ctrl+w', 'cmd+w', 'q']
description = 'Quit the figure'

trigger(self, sender, event, data=None)
    Called when this tool gets used.

    This method is called by matplotlib.backend_managers.ToolManager.trigger_tool.
```

### Parameters

#### `event`

[`Event`] The canvas event that caused this tool to be called.

#### `sender`

[object] Object that requested the tool to be triggered.

#### `data`

[object] Extra data.

```
class matplotlib.backend_tools.ToolQuitAll(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase

Tool to call the figure manager destroy method.

default_keymap = []
description = 'Quit all figures'
trigger(self, sender, event, data=None)
    Called when this tool gets used.

    This method is called by matplotlib.backend_managers.ToolManager.trigger_tool.
```

### Parameters

#### event

[Event] The canvas event that caused this tool to be called.

#### sender

[object] Object that requested the tool to be triggered.

#### data

[object] Extra data.

```
class matplotlib.backend_tools.ToolToggleBase(*args, **kwargs)
Bases: matplotlib.backend_tools.ToolBase
```

Toggleable tool.

Every time it is triggered, it switches between enable and disable.

### Parameters

#### ``\*args``

Variable length argument to be used by the Tool.

#### ``\*\*kwargs``

*toggled* if present and True, sets the initial state of the Tool Arbitrary keyword arguments to be consumed by the Tool

#### cursor = None

Cursor to use when the tool is active.

#### default\_toggled = False

Default of toggled state.

#### disable(self, event=None)

Disable the toggle tool.

*trigger* call this method when *toggled* is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`.
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`).

**enable** (*self, event=None*)

Enable the toggle tool.

*trigger* calls this method when `toggled` is False.

**radio\_group = None**

Attribute to group 'radio' like tools (mutually exclusive).

**String** that identifies the group or **None** if not belonging to a group.

**set\_figure** (*self, figure*)

Assign a figure to the tool.

### Parameters

**figure**

[*Figure*]

**property toggled**

State of the toggled tool.

**trigger** (*self, sender, event, data=None*)

Calls `enable` or `disable` based on `toggled` value.

**class** `matplotlib.backend_tools.ToolViewsPositions` (\*args, \*\*kwargs)

Bases: `matplotlib.backend_tools.ToolBase`

Auxiliary Tool to handle changes in views and positions.

Runs in the background and should get used by all the tools that need to access the figure's history of views and positions, e.g.

- `ToolZoom`
- `ToolPan`
- `ToolHome`
- `ToolBack`
- `ToolForward`

**add\_figure** (*self, figure*)

Add the current figure to the stack of views and positions.

**back** (*self*)

Back one step in the stack of views and positions.

**clear** (*self, figure*)

Reset the axes stack.

**forward(self)**

Forward one step in the stack of views and positions.

**home(self)**

Recall the first view and position from the stack.

**push\_current(self, figure=None)**

Push the current view limits and position onto their respective stacks.

**refresh\_locators(self)**

[*Deprecated*] Redraw the canvases, update the locators.

### Notes

Deprecated since version 3.3.

**update\_home\_views(self, figure=None)**

Make sure that `self.home_views` has an entry for all axes present in the figure.

**update\_view(self)**

Update the view limits and position for each axes from the current stack position. If any axes are present in the figure that aren't in the current stack position, use the home view limits for those axes and don't update *any* positions.

**class matplotlib.backend\_tools.ToolXScale(\*args, \*\*kwargs)**

Bases: `matplotlib.backend_tools.AxisScaleBase`

Tool to toggle between linear and logarithmic scales on the X axis.

`default_keymap = ['k', 'L']`

`description = 'Toggle scale X axis'`

`set_scale(self, ax, scale)`

**class matplotlib.backend\_tools.ToolYScale(\*args, \*\*kwargs)**

Bases: `matplotlib.backend_tools.AxisScaleBase`

Tool to toggle between linear and logarithmic scales on the Y axis.

`default_keymap = ['l']`

`description = 'Toggle scale Y axis'`

`set_scale(self, ax, scale)`

**class matplotlib.backend\_tools.ToolZoom(\*args)**

Bases: `matplotlib.backend_tools.ZoomPanBase`

A Tool for zooming using a rectangle selector.

`cursor = 2`

`default_keymap = ['o']`

`description = 'Zoom to rectangle'`

```

image = 'zoom_to_rect'
radio_group = 'default'

class matplotlib.backend_tools.ViewsPositionsBase(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase
Base class for ToolHome, ToolBack and ToolForward.

trigger(self, sender, event, data=None)
Called when this tool gets used.

This method is called by matplotlib.backend_managers.ToolManager.
trigger_tool.

```

**Parameters****event**

[Event] The canvas event that caused this tool to be called.

**sender**

[object] Object that requested the tool to be triggered.

**data**

[object] Extra data.

```

class matplotlib.backend_tools.ZoomPanBase(*args)
Bases: matplotlib.backend_tools.ToolToggleBase

```

Base class for ToolZoom and ToolPan.

**disable**(self, event)

Release the canvas and disconnect press/release events.

**enable**(self, event)

Connect press/release events and lock the canvas.

**scroll\_zoom**(self, event)**trigger**(self, sender, event, data=None)

Calls `enable` or `disable` based on toggled value.

```

matplotlib.backend_tools.add_tools_to_container(container,
                                                tools=[[navigation,
                                                       ['home', 'back', 'forward']],
                                                       ['zoompan', ['pan', 'zoom',
                                                       'subplots']],
                                                       ['io', ['save', 'help']]])

```

Add multiple tools to the container.

**Parameters****container**

[Container] `backend_bases.ToolContainerBase` object that will get the tools added.

### tools

[list, optional] List in the form `[[group1, [tool1, tool2 ...]], [group2, [...]]]` where the tools `[tool1, tool2, ...]` will display in group1. See `add_tool` for details.

```
matplotlib.backend_tools.add_tools_to_manager(toolmanager,  
                                         tools={'home': <class 'mat-  
                                         plotlib.backend_tools.ToolHome'>,  
                                         'back': <class 'mat-  
                                         plotlib.backend_tools.ToolBack'>,  
                                         'forward': <class 'mat-  
                                         plotlib.backend_tools.ToolForward'>,  
                                         'zoom': <class 'mat-  
                                         plotlib.backend_tools.ToolZoom'>,  
                                         'pan': <class 'mat-  
                                         plotlib.backend_tools.ToolPan'>,  
                                         'subplots': 'ToolConfigureSub-  
                                         plots', 'save': 'ToolSave-  
                                         Figure', 'grid': <class 'mat-  
                                         plotlib.backend_tools.ToolGrid'>,  
                                         'grid_minor': <class 'mat-  
                                         plotlib.backend_tools.ToolMinorGrid'>,  
                                         'fullscreen': <class 'mat-  
                                         plotlib.backend_tools.ToolFullScreen'>,  
                                         'quit': <class 'mat-  
                                         plotlib.backend_tools.ToolQuit'>,  
                                         'quit_all': <class 'mat-  
                                         plotlib.backend_tools.ToolQuitAll'>,  
                                         'allnav': <class 'mat-  
                                         plotlib.backend_tools._ToolEnableAllNavigation'>,  
                                         'nav': <class 'mat-  
                                         plotlib.backend_tools._ToolEnableNavigation'>,  
                                         'xscale': <class 'mat-  
                                         plotlib.backend_tools.ToolXScale'>,  
                                         'yscale': <class 'mat-  
                                         plotlib.backend_tools.ToolYScale'>,  
                                         'position': <class 'mat-  
                                         plotlib.backend_tools.ToolCursorPosition'>,  
                                         'viewpos': <class 'mat-  
                                         plotlib.backend_tools.ToolViewsPositions'>,  
                                         'cursor': 'ToolSetCursor', 'rub-  
                                         berband': 'ToolRubberband',  
                                         'help': 'ToolHelp', 'copy':  
                                         'ToolCopyToClipboard'})
```

Add multiple tools to a `ToolManager`.

## Parameters

### toolmanager

[*backend\_managers.ToolManager*] Manager to which the tools are added.

### tools

[{str: class\_like}, optional] The tools to add in a {name: tool} dict, see add\_tool for more info.

`matplotlib.backend_tools.Cursors`

alias of `matplotlib.backend_tools.Cursors`

`matplotlib.backend_tools.default_toolbar_tools = [['navigation', ['home', 'back']]`  
Default tools in the toolbar

`matplotlib.backend_tools.default_tools = {'allnav': <class 'matplotlib.backend_too`  
Default tools

## 18.10 `matplotlib.backends`

### 18.10.1 `matplotlib.backends.backend_mixed`

**class** `matplotlib.backends.backend_mixed.MixedModeRenderer`(*figure, width, height, dpi, vector\_renderer, raster\_renderer\_class=None, bbox\_inches\_restore=None*)

Bases: `object`

A helper class to implement a renderer that switches between vector and raster drawing. An example may be a PDF writer, where most things are drawn with PDF vector commands, but some very complex objects, such as quad meshes, are rasterised and then output as images.

## Parameters

### figure

[*matplotlib.figure.Figure*] The figure instance.

### width

[scalar] The width of the canvas in logical units

### height

[scalar] The height of the canvas in logical units

### dpi

[float] The dpi of the canvas

**vector\_renderer**

[*matplotlib.backend\_bases.RendererBase*] An instance of a subclass of *RendererBase* that will be used for the vector drawing.

**raster\_renderer\_class**

[*matplotlib.backend\_bases.RendererBase*] The renderer class to use for the raster drawing. If not provided, this will use the Agg backend (which is currently the only viable option anyway.)

**start\_rasterizing(*self*)**

Enter "raster" mode. All subsequent drawing commands (until *stop\_rasterizing* is called) will be drawn with the raster backend.

**stop\_rasterizing(*self*)**

Exit "raster" mode. All of the drawing that was done since the last *start\_rasterizing* call will be copied to the vector backend by calling *draw\_image*.

## 18.10.2 `matplotlib.backends.backend_template`

A fully functional, do-nothing backend intended as a template for backend writers. It is fully functional in that you can select it as a backend e.g. with

```
import matplotlib
matplotlib.use("template")
```

and your program will (should!) run without error, though no output is produced. This provides a starting point for backend writers; you can selectively implement drawing methods (*draw\_path*, *draw\_image*, etc.) and slowly see your figure come to life instead having to have a full blown implementation before getting any results.

Copy this file to a directory outside of the Matplotlib source tree, somewhere where Python can import it (by adding the directory to your `sys.path` or by packaging it as a normal Python package); if the backend is importable as `import my.backend` you can then select it using

```
import matplotlib
matplotlib.use("module://my.backend")
```

If your backend implements support for saving figures (i.e. has a `print_xyz` method), you can register it as the default handler for a given file type:

```
from matplotlib.backend_bases import register_backend
register_backend('xyz', 'my_backend', 'XYZ File Format')
...
plt.savefig("figure.xyz")
```

`matplotlib.backends.backend_template.FigureCanvas`

alias of `matplotlib.backends.backend_template.FigureCanvasTemplate`

**class** `matplotlib.backends.backend_template.FigureCanvasTemplate` (`figure=None`)  
Bases: `matplotlib.backend_bases.FigureCanvasBase`

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc.

Note: GUI templates will want to connect events for button presses, mouse movements and key presses to functions that call the base class methods button\_press\_event, button\_release\_event, motion\_notify\_event, key\_press\_event, and key\_release\_event. See the implementations of the interactive backends for examples.

## Attributes

### `figure`

[`matplotlib.figure.Figure`] A high-level Figure instance

### `draw(self)`

Draw the figure using the renderer.

It is important that this method actually walk the artist tree even if no output is produced because this will trigger deferred work (like computing limits auto-limits and tick values) that users may want access to before saving to disk.

`filetypes = {'eps': 'Encapsulated Postscript', 'foo': 'My magic Foo format', ...}`

### `get_default_filetype(self)`

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

### `print_foo(self, filename, *args, **kwargs)`

Write out format foo.

This method is normally called via `Figure.savefig` and `FigureCanvasBase.print_figure`, which take care of setting the figure facecolor, edgecolor, and dpi to the desired output values, and will restore them to the original values. Therefore, `print_foo` does not need to handle these settings.

`matplotlib.backends.backend_template.FigureManager`

alias of `matplotlib.backends.backend_template.FigureManagerTemplate`

**class** `matplotlib.backends.backend_template.FigureManagerTemplate(canvas, num)`

Bases: `matplotlib.backend_bases.FigureManagerBase`

Helper class for pyplot mode, wraps everything up into a neat bundle.

For non-interactive backends, the base class is sufficient.

**class** `matplotlib.backends.backend_template.GraphicsContextTemplate`

Bases: `matplotlib.backend_bases.GraphicsContextBase`

The graphics context provides the color, line styles, etc... See the cairo and postscript backends for examples of mapping the graphics context attributes (cap styles, join styles, line widths, colors) to a particular backend. In cairo this is done by wrapping a cairo.Context object and forwarding the

appropriate calls to it using a dictionary mapping styles to gdk constants. In Postscript, all the work is done by the renderer, mapping line styles to postscript calls.

If it's more appropriate to do the mapping at the renderer level (as in the postscript backend), you don't need to override any of the GC methods. If it's more appropriate to wrap an instance (as in the cairo backend) and do the mapping here, you'll need to override several of the setter methods.

The base GraphicsContext stores colors as a RGB tuple on the unit interval, e.g., (0.5, 0.0, 1.0). You may need to map this to colors appropriate for your backend.

**class** `matplotlib.backends.backend_template.RendererTemplate(dpi)`  
Bases: `matplotlib.backend_bases.RendererBase`

The renderer handles drawing/rendering operations.

This is a minimal do-nothing class that can be used to get started when writing a new backend. Refer to `backend_bases.RendererBase` for documentation of the methods.

**draw\_image** (*self, gc, x, y, im*)

Draw an RGBA image.

### Parameters

**gc**

[*GraphicsContextBase*] A graphics context with clipping information.

**x**

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y**

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im**

[(N, M, 4) array-like of np.uint8] An array of RGBA pixels.

### transform

[*matplotlib.transforms.Affine2D*] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an *Affine2D*) *may* be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

**draw\_path** (*self, gc, path, transform, rgbFace=None*)

Draw a *Path* instance using the given affine transform.

**draw\_text** (*self, gc, x, y, s, prop, angle, ismath=False, mtext=None*)

Draw the text instance.

## Parameters

**gc**

[*GraphicsContextBase*] The graphics context.

**x**

[float] The x location of the text in display coords.

**y**

[float] The y location of the text baseline in display coords.

**s**

[str] The text string.

**prop**

[*matplotlib.font\_manager.FontProperties*] The font properties.

**angle**

[float] The rotation angle in degrees anti-clockwise.

**mtext**

[*matplotlib.text.Text*] The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

**fliipy** (*self*)

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

**get\_canvas\_width\_height** (*self*)

Return the canvas width and height in display coords.

**get\_text\_width\_height\_descent** (*self*, *s*, *prop*, *ismath*)

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

**new\_gc** (*self*)

Return an instance of a *GraphicsContextBase*.

`points_to_pixels(self, points)`

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points_to_pixels = points * pixels_per_inch/72 * dpi/72
```

### Parameters

#### points

[float or array-like] a float or a numpy array of float

### Returns

#### Points converted to pixels

`matplotlib.backends.backend_template.draw_if_interactive()`

For image backends - is not required. For GUI backends - this should be overridden if drawing should be done in interactive python mode.

```
matplotlib.backends.backend_template.new_figure_manager(num,      *args,
                                                       Figure-
                                                       Class=<class
                                                       'mat-
                                                       plotlib.figure.Figure'>,
                                                       **kwargs)
```

Create a new figure manager instance.

```
matplotlib.backends.backend_template.new_figure_manager_given_figure(num,
                                                                     fig-
                                                                     ure)
```

Create a new figure manager instance for the given figure.

`matplotlib.backends.backend_template.show(*, block=None)`

For image backends - is not required. For GUI backends - show() is usually the last line of a pyplot script and tells the backend that it is time to draw. In interactive mode, this should do nothing.

### 18.10.3 `matplotlib.backends.backend_agg`

An Anti-Grain Geometry (AGG) backend.

Features that are implemented:

- capstyles and join styles
- dashes
- linewidth
- lines, rectangles, ellipses

- clipping to a rectangle
- output to RGBA and Pillow-supported image formats
- alpha blending
- DPI scaling properly - everything scales properly (dashes, linewidths, etc)
- draw polygon
- freetype2 w/ ft2font

Still TODO:

- integrate screen dpi w/ ppi and text

```
matplotlib.backends.backend_agg.FigureCanvas
    alias of matplotlib.backends.backend_agg.FigureCanvasAgg

class matplotlib.backends.backend_agg.FigureCanvasAgg (figure=None)
    Bases: matplotlib.backend_bases.FigureCanvasBase

buffer_rgba (self)
    Get the image as a memoryview to the renderer's buffer.

    draw must be called at least once before this function will work and to update the renderer for
    any subsequent changes to the Figure.

copy_from_bbox (self, bbox)
draw (self)
    Render the Figure.

    It is important that this method actually walk the artist tree even if not output is produced because
    this will trigger deferred work (like computing limits auto-limits and tick values) that users may
    want access to before saving to disk.

get_renderer (self, cleared=False)
print_jpeg (self, filename_or_obj, *args, pil_kwags=None, **kwargs)
    Write the figure to a JPEG file.
```

## Parameters

### `filename_or_obj`

[str or path-like or file-like] The file to write to.

## Other Parameters

### `quality`

[int, default: `rcParams["savefig.jpeg_quality"]`] (default: 95) The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

**optimize**

[bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.

**progressive**

[bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

**pil\_kwarg**

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure. These take precedence over *quality*, *optimize* and *progressive*.

**print\_jpg** (*self, filename\_or\_obj, \*args, pil\_kwarg=None, \*\*kwargs*)

Write the figure to a JPEG file.

**Parameters****filename\_or\_obj**

[str or path-like or file-like] The file to write to.

**Other Parameters****quality**

[int, default: `rcParams["savefig.jpeg_quality"]`] (default: 95) The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

**optimize**

[bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.

**progressive**

[bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

**pil\_kwarg**

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure. These take precedence over *quality*, *optimize* and *progressive*.

**print\_png** (*self, filename\_or\_obj, \*args, metadata=None, pil\_kwarg=None*)

Write the figure to a PNG file.

**Parameters**

**filename\_or\_obj**

[str or path-like or file-like] The file to write to.

**metadata**

[dict, optional] Metadata in the PNG file as key-value pairs of bytes or latin-1 encodable strings. According to the PNG specification, keys must be shorter than 79 chars.

The [PNG specification](#) defines some common keywords that may be used as appropriate:

- Title: Short (one line) title or caption for image.
- Author: Name of image's creator.
- Description: Description of image (possibly long).
- Copyright: Copyright notice.
- Creation Time: Time of original image creation (usually RFC 1123 format).
- Software: Software used to create the image.
- Disclaimer: Legal disclaimer.
- Warning: Warning of nature of content.
- Source: Device used to create the image.
- Comment: Miscellaneous comment; conversion from other image format.

Other keywords may be invented for other purposes.

If 'Software' is not given, an autogenerated value for Matplotlib will be used. This can be removed by setting it to *None*.

For more details see the [PNG specification](#).

**pil\_kwarg**

[dict, optional] Keyword arguments passed to [PIL.Image.Image.save](#).

If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

```
print_raw(self,filename_or_obj,*args)
print_rgba(self,filename_or_obj,*args)
print_tif(self,filename_or_obj,*,pil_kwarg=None)
print_tiff(self,filename_or_obj,*,pil_kwarg=None)
print_to_buffer(self)
restore_region(self,region,bbox=None,xy=None)
```

**tostring\_argb(self)**

Get the image as ARGB bytes.

`draw` must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

**tostring\_rgb(self)**

Get the image as RGB bytes.

`draw` must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

**class** `matplotlib.backends.backend_agg.RendererAgg(width, height, dpi)`

Bases: `matplotlib.backend_bases.RendererBase`

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles

**buffer\_rgba(self)****clear(self)****draw\_mathtext(self, gc, x, y, s, prop, angle)**

Draw mathtext using `matplotlib.mathtext`.

**draw\_path(self, gc, path, transform, rgbFace=None)**

Draw a `Path` instance using the given affine transform.

**draw\_path\_collection(self, gc, master\_transform, paths, all\_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset\_position)**

Draw a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied.

`offset_position` may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

**draw\_tex(self, gc, x, y, s, prop, angle, \*, mtext=None)****draw\_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)**

Draw the text instance.

**Parameters****gc**

[*GraphicsContextBase*] The graphics context.

**x**

[float] The x location of the text in display coords.

**y**

[float] The y location of the text baseline in display coords.

**s**

[str] The text string.

**prop**

`[matplotlib.font_manager.FontProperties]` The font properties.

**angle**

[float] The rotation angle in degrees anti-clockwise.

**mtext**

`[matplotlib.text.Text]` The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

**get\_canvas\_width\_height (self)**

Return the canvas width and height in display coords.

**get\_content\_extents (self)**

*[Deprecated]*

## Notes

Deprecated since version 3.4:

**get\_text\_width\_height\_descent (self, s, prop, ismath)**

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with `FontProperties prop`.

**lock = <unlocked \_thread.RLock object owner=0 count=0>**

**option\_image\_nocomposite (self)**

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

**option\_scale\_image(self)**

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

**points\_to\_pixels(self, points)**

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

**Parameters****points**

[float or array-like] a float or a numpy array of float

**Returns****Points converted to pixels****restore\_region(self, region, bbox=None, xy=None)**

Restore the saved region. If bbox (instance of BboxBase, or its extents) is given, only the region specified by the bbox will be restored. `xy` (a pair of floats) optionally specifies the new position (the LLC of the original region, not the LLC of the bbox) where the region will be restored.

```
>>> region = renderer.copy_from_bbox()  
>>> x1, y1, x2, y2 = region.get_extents()  
>>> renderer.restore_region(region, bbox=(x1+dx, y1, x2, y2),  
...                                xy=(x1-dx, y1))
```

**start\_filter(self)**

Start filtering. It simply create a new canvas (the old one is saved).

**stop\_filter(self, post\_processing)**

Save the plot in the current canvas as a image and apply the `post_processing` function.

**def post\_processing(image, dpi):**

```
# ny, nx, depth = image.shape # image (numpy array) has RGBA channels and has  
# a depth of 4. ... # create a new_image (numpy array of 4 channels, size can be  
# different). The resulting image may have offsets from # lower-left corner of the  
# original image return new_image, offset_x, offset_y
```

The saved renderer is restored and the returned image from `post_processing` is plotted (using `draw_image`) on it.

**tostring\_argb(self)**

```
tostring_rgb(self)
tostring_rgba_minimized(self)
    [Deprecated]
```

## Notes

Deprecated since version 3.4:

```
matplotlib.backends.backend_agg.get_hinting_flag()
```

### 18.10.4 matplotlib.backends.backend\_cairo

#### A Cairo backend for matplotlib

##### Author

Steve Chaplin and others

This backend depends on cairoffi or pycairo.

```
matplotlib.backends.backend_cairo.FigureCanvas
    alias of matplotlib.backends.backend\_cairo.FigureCanvasCairo

class matplotlib.backends.backend_cairo.FigureCanvasCairo(figure=None)
    Bases: matplotlib.backend\_bases.FigureCanvasBase

copy_from_bbox(self, bbox)
print_pdf(self, fobj, *args, **kwargs)
print_png(self, fobj)
print_ps(self, fobj, *args, **kwargs)
print_raw(self, fobj)
print_rgba(self, fobj)
print_svg(self, fobj, *args, **kwargs)
print_svgz(self, fobj, *args, **kwargs)
restore_region(self, region)

class matplotlib.backends.backend_cairo.GraphicsContextCairo(renderer)
    Bases: matplotlib.backend\_bases.GraphicsContextBase

get_rgb(self)
    Return a tuple of three or four floats from 0-1.

restore(self)
    Restore the graphics context from the stack - needed only for backends that save graphics contexts
    on a stack.
```

**set\_alpha**(*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

**set\_antialiased**(*self, b*)

Set whether object should be drawn with antialiased rendering.

**set\_capstyle**(*self, cs*)

Set how to draw endpoints of lines.

**Parameters****cs**

[`CapStyle` or {'butt', 'projecting', 'round'}]

**set\_clip\_path**(*self, path*)

Set the clip path to a `TransformedPath` or None.

**set\_clip\_rectangle**(*self, rectangle*)

Set the clip rectangle to a `Bbox` or None.

**set\_dashes**(*self, offset, dashes*)

Set the dash style for the gc.

**Parameters****dash\_offset**

[float or None] The offset (usually 0).

**dash\_list**

[array-like or None] The on-off sequence as points.

**Notes**

(`None`, `None`) specifies a solid line.

See p. 107 of to PostScript `blue book` for more info.

**set\_foreground**(*self, fg, isRGBA=None*)

Set the foreground color.

**Parameters****fg**

[color]

**isRGBA**

[bool] If *fg* is known to be an (*r*, *g*, *b*, *a*) tuple, *isRGBA* can be set to True to improve performance.

**set\_joinstyle**(*self, js*)

Set how to draw connections between line segments.

**Parameters****js**

[*JoinStyle* or {'miter', 'round', 'bevel'}]

**set\_linewidth**(*self, w*)

Set the linewidth in points.

**class** matplotlib.backends.backend\_cairo.RendererCairo(*dpi*)

Bases: *matplotlib.backend\_bases.RendererBase*

**draw\_image**(*self, gc, x, y, im*)

Draw an RGBA image.

**Parameters****gc**

[*GraphicsContextBase*] A graphics context with clipping information.

**x**

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y**

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im**

[(N, M, 4) array-like of np.uint8] An array of RGBA pixels.

**transform**

[*matplotlib.transforms.Affine2D*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation (i.e., an *Affine2D*) *may* be passed to *draw\_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

**draw\_markers**(*self, gc, marker\_path, marker\_trans, path, transform, rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

#### gc

[*GraphicsContextBase*] The graphics context.

#### marker\_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

#### trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

#### draw\_path (self, gc, path, transform, rgbFace=None)

Draw a `Path` instance using the given affine transform.

#### draw\_text (self, gc, x, y, s, prop, angle, ismath=False, mtext=None)

Draw the text instance.

### Parameters

#### gc

[*GraphicsContextBase*] The graphics context.

#### x

[float] The x location of the text in display coords.

#### y

[float] The y location of the text baseline in display coords.

#### s

[str] The text string.

#### prop

[*matplotlib.font\_manager.FontProperties*] The font properties.

#### angle

[float] The rotation angle in degrees anti-clockwise.

#### mtext

[*matplotlib.text.Text*] The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

**property fontangles**

**property fontweights**

**get\_canvas\_width\_height(self)**

Return the canvas width and height in display coords.

**get\_text\_width\_height\_descent(self, s, prop, ismath)**

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

**property mathtext\_parser**

**new\_gc(self)**

Return an instance of a *GraphicsContextBase*.

**points\_to\_pixels(self, points)**

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

## Parameters

### points

[float or array-like] a float or a numpy array of float

### Returns

#### Points converted to pixels

**set\_ctx\_from\_surface(self, surface)**

**set\_width\_height(self, width, height)**

**NOTE** These backends are not documented here, to avoid adding a dependency to building the docs.

## 18.10.5 matplotlib.backends.backend\_gtk3agg

## 18.10.6 matplotlib.backends.backend\_gtk3cairo

## 18.10.7 matplotlib.backends.backend\_nbagg

## Interactive figures in the IPython notebook

```
class matplotlib.backends.backend_nbagg.CommSocket (manager)
    Bases: object
```

Manages the Comm connection between IPython and the browser (client).

Comms are 2 way, with the CommSocket being able to publish a message via the send\_json method, and handle a message with on\_message. On the JS side figure.send\_message and figure.ws.onmessage do the sending and receiving respectively.

**is\_open**(*self*)

**on\_close (self)**

**on\_message** (*self, message*)

**send\_binary**(*self*, *blob*)

**send\_json** (*self, content*)

`matplotlib.backends.backend_nbagg.FigureCanvas`

alias of `matplotlib.backends.backend_nbagg.FigureCanvasNbAgg`

```
class matplotlib.backends.backend_nbagg.FigureCanvasNbAgg(*args,  
**kwargs)
```

Bases: matplotlib.backends.backend\_webagg\_core.FigureCanvasWebAggCore

```
matplotlib.backends.backend_nbagg.FigureManager
```

alias of `matplotlib.backends.backend_nbagg.FigureManagerNbAgg`

```
class matplotlib.backends.backend_nbagg.FigureManagerNbAgg(canvas,  
                                         num)
```

Bases: `matplotlib.backends.backend_webagg_core.FigureManagerWebAgg`

## ToolbarCls

alias of *NavigationIPy*

`cleanup_closed(self)`

Clear up any closed Comms.

## property connected

**destroy**(*self*)

display is (*self*)

classmethod get

**remove\_comm**(*self comm id*)

**reshape(*self*)**

A special method to re-show the figure in the notebook.

**show(*self*)**

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in [Figure.show](#).

**class matplotlib.backends.backend\_nbagg.NavigationIPy(canvas)**

Bases: [matplotlib.backends.backend\\_webagg\\_core](#).

[NavigationToolbar2WebAgg](#)

```
toolitems = [('Home', 'Reset original view', 'fa fa-home icon-home', 'home'),
```

**matplotlib.backends.backend\_nbagg.connection\_info()**

Return a string showing the figure and connection status for the backend.

This is intended as a diagnostic tool, and not for general use.

**matplotlib.backends.backend\_nbagg.new\_figure\_manager\_given\_figure(num,**

*fig-  
ure*)

Create a new figure manager instance for the given figure.

**matplotlib.backends.backend\_nbagg.show(block=None)**

Show all figures.

*show* blocks by calling mainloop if *block* is True, or if it is None and we are neither in IPython's %pylab mode, nor in interactive mode.

## 18.10.8 matplotlib.backends.backend\_pdf

A PDF matplotlib backend Author: Jouni K Seppänen <[jks@iki.fi](mailto:jks@iki.fi)>

**matplotlib.backends.backend\_pdf.FigureCanvas**

alias of [matplotlib.backends.backend\\_pdf.FigureCanvasPdf](#)

**class matplotlib.backends.backend\_pdf.FigureCanvasPdf(*figure=None*)**

Bases: [matplotlib.backends\\_bases.FigureCanvasBase](#)

**draw(*self*)**

Render the [Figure](#).

It is important that this method actually walk the artist tree even if no output is produced because this will trigger deferred work (like computing limits auto-limits and tick values) that users may want access to before saving to disk.

```
filetypes = {'pdf': 'Portable Document Format'}
```

```
fixed_dpi = 72
```

**get\_default\_filetype(*self*)**

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

```
print_pdf(self, filename, *, dpi=<deprecated parameter>, bbox_inches_restore=None,
           metadata=None)

class matplotlib.backends.backend_pdf.GraphicsContextPdf(file)
    Bases: matplotlib.backend_bases.GraphicsContextBase

    alpha_cmd(self, alpha, forced, effective_alphas)

    capstyle_cmd(self, style)

    capstyles = {'butt': 0, 'projecting': 2, 'round': 1}

    clip_cmd(self, cliprect, clippath)
        Set clip rectangle. Calls pop() and push().

    commands = ((('_cliprect', '_clippath'), <function GraphicsContextPdf.clip_cmd>),
                ...)

    copy_properties(self, other)
        Copy properties of other into self.

    dash_cmd(self, dashes)

    delta(self, other)
        Copy properties of other into self and return PDF commands needed to transform self into other.

    fill(self, *args)
        Predicate: does the path need to be filled?

        An optional argument can be used to specify an alternative _fillcolor, as needed by RendererPdf.draw_markers.

    fillcolor_cmd(self, rgb)

    finalize(self)
        Make sure every pushed graphics state is popped.

    hatch_cmd(self, hatch, hatch_color)

    joinstyle_cmd(self, style)

    joinstyles = {'bevel': 2, 'miter': 0, 'round': 1}

    linewidth_cmd(self, width)

    paint(self)
        Return the appropriate pdf operator to cause the path to be stroked, filled, or both.

    pop(self)

    push(self)

    rgb_cmd(self, rgb)

    stroke(self)
        Predicate: does the path need to be stroked (its outline drawn)? This tests for the various conditions that disable stroking the path, in which case it would presumably be filled.
```

```
class matplotlib.backends.backend_pdf.Name(name)
Bases: object

PDF name object.

static hexify(match)

name

pdfRepr(self)

class matplotlib.backends.backend_pdf.Op(value)
Bases: matplotlib.backends.backend_pdf.Operator, enum.Enum

An enumeration.

begin_text = (b'BT',)
clip = b'W'
close_fill_stroke = b'b'
close_stroke = b's'
closepath = (b'h',)
concat_matrix = b'cm'
curveto = b'c'
end_text = b'ET'
endpath = b'n'
fill = b'f'
fill_stroke = b'B'
grestore = b'Q'
gsave = (b'q',)
lineto = b'l'
moveto = (b'm',)
op

classmethod paint_path(fill, stroke)
    Return the PDF operator to paint a path.
```

### Parameters

#### fill

[bool] Fill the path with the fill color.

#### stroke

[bool] Stroke the outline of the path with the line color.

```
rectangle = b're'
selectfont = b'Tf'
setcolor_nonstroke = b'scn'
setcolor_stroke = b'SCN'
setcolorspace_nonstroke = (b'cs',)
setcolorspace_stroke = b'CS'
setdash = (b'd',)
setgray_nonstroke = b'g'
setgray_stroke = (b'G',)
setgstate = b'gs'
setlinecap = b'J'
setlinejoin = b'j'
setlinewidth = b'w'
setrgb_nonstroke = (b'rg',)
setrgb_stroke = b'RG'
shading = b'sh'
show = b'Tj'
showkern = b'TJ'
stroke = b'S'
textmatrix = (b'Tm',)
textpos = b'Td'
use_xobject = b'Do'

class matplotlib.backends.backend_pdf.Operator(op)
    Bases: object
    PDF operator object.

    op
    pdfRepr(self)

class matplotlib.backends.backend_pdf.PdfFile(filename, metadata=None)
    Bases: object
    PDF file object.

    Parameters
```

**filename**

[str or path-like or file-like] Output target; if a string, a file will be opened for writing.

**metadata**

[dict from strings to strings and dates] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: { 'Creator' : 'My software', 'Author' : 'Me', 'Title' : 'Awesome' }.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

**`addGouraudTriangles` (*self, points, colors*)**

Add a Gouraud triangle shading.

**Parameters****points**

[np.ndarray] Triangle vertices, shape (n, 3, 2) where n = number of triangles, 3 = vertices, 2 = x, y.

**colors**

[np.ndarray] Vertex colors, shape (n, 3, 1) or (n, 3, 4) as with points, but last dimension is either (gray,) or (r, g, b, alpha).

**Returns****Name, Reference****`alphaState` (*self, alpha*)**

Return name of an ExtGState that sets alpha to the given value.

**`beginStream` (*self, id, len, extra=None, png=None*)****`close` (*self*)**

Flush all buffers and free all resources.

**`createType1Descriptor` (*self, t1font, fontfile*)****`dviFontName` (*self, dvifont*)**

Given a dvi font object, return a name suitable for `Op.selectfont`. This registers the font information in `self.dviFontInfo` if not yet registered.

**`embedTTF` (*self, filename, characters*)**

Embed the TTF font from the named file into the document.

**`endStream` (*self*)****`finalize` (*self*)**

Write out the various deferred objects and the pdf end matter.

**fontName** (*self, fontprop*)

Select a font based on fontprop and return a name suitable for Op.selectfont. If fontprop is a string, it will be interpreted as the filename of the font.

**hatchPattern** (*self, hatch\_style*)**imageObject** (*self, image*)

Return name of an image XObject representing the given image.

**markerObject** (*self, path, trans, fill, stroke, lw, joinstyle, capstyle*)

Return name of a marker XObject representing the given path.

**newPage** (*self, width, height*)**newTextnote** (*self, text, positionRect=[- 100, - 100, 0, 0]*)**output** (*self, \*data*)**pathCollectionObject** (*self, gc, path, trans, padding, filled, stroked*)**static pathOperations** (*path, transform, clip=None, simplify=None, sketch=None*)**recordXref** (*self, id*)**reserveObject** (*self, name=""*)

Reserve an ID for an indirect object.

The name is used for debugging in case we forget to print out the object with writeObject.

**property used\_characters****write** (*self, data*)**writeExtGStates** (*self*)**writeFonts** (*self*)**writeGouraudTriangles** (*self*)**writeHatches** (*self*)**writeImages** (*self*)**writeInfoDict** (*self*)

Write out the info dictionary, checking it for good form

**writeMarkers** (*self*)**writeObject** (*self, object, contents*)**writePath** (*self, path, transform, clip=False, sketch=None*)**writePathCollectionTemplates** (*self*)**writeTrailer** (*self*)

Write out the PDF trailer.

**writeXref** (*self*)

Write out the xref table.

```
class matplotlib.backends.backend_pdf.PdfPages (filename, keep_empty=True,
                                               metadata=None)
```

Bases: `object`

A multi-page PDF file.

## Notes

In reality `PdfPages` is a thin wrapper around `PdfFile`, in order to avoid confusion when using `savefig` and forgetting the format argument.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

### Parameters

#### filename

[str or path-like or file-like] Plots using `PdfPages.savefig` will be written to a file at this location. The file is opened at once and any older file with the same name is overwritten.

#### keep\_empty

[bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.

#### metadata

[dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}`.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

#### attach\_note (self, text, positionRect=[-100, -100, 0, 0])

Add a new text note to the page to be saved next. The optional positionRect specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

**close (self)**

Finalize this object, making the underlying file a complete PDF file.

**get\_pagecount (self)**

Return the current number of pages in the multipage pdf file.

**infodict (self)**

Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

**keep\_empty****savefig (self, figure=None, \*\*kwargs)**

Save a *Figure* to this file as a new page.

Any other keyword arguments are passed to *savefig*.

**Parameters****figure**

[*Figure* or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

**class matplotlib.backends.backend\_pdf.Reference (id)**

Bases: *object*

PDF reference object.

Use PdfFile.reserveObject() to create References.

**pdfRepr (self)****write (self, contents, file)****class matplotlib.backends.backend\_pdf.RendererPdf (file, image\_dpi, height, width)**

Bases: *matplotlib.backends.\_backend\_pdf\_ps.RendererPDFPSBase*

**check\_gc (self, gc, fillcolor=None)****draw\_gouraud\_triangle (self, gc, points, colors, trans)**

Draw a Gouraud-shaded triangle.

**Parameters****gc**

[*GraphicsContextBase*] The graphics context.

**points**

[(3, 2) array-like] Array of (x, y) points for the triangle.

**colors**

[(3, 4) array-like] RGBA colors for each point of the triangle.

**transform**

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

**draw\_gouraud\_triangles**(*self, gc, points, colors, trans*)

Draw a series of Gouraud triangles.

**Parameters****points**

[(N, 3, 2) array-like] Array of  $N$  (x, y) points for the triangles.

**colors**

[(N, 3, 4) array-like] Array of  $N$  RGBA colors for each point of the triangles.

**transform**

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

**draw\_image**(*self, gc, x, y, im, transform=None*)

Draw an RGBA image.

**Parameters****gc**

[*GraphicsContextBase*] A graphics context with clipping information.

**x**

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y**

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im**

[(N, M, 4) array-like of np.uint8] An array of RGBA pixels.

**transform**

[*matplotlib.transforms.Affine2D*] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an *Affine2D*) *may* be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

**draw\_markers** (*self, gc, marker\_path, marker\_trans, path, trans, rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

**gc**

[*GraphicsContextBase*] The graphics context.

**marker\_trans**

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans**

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

**draw\_mathtext** (*self, gc, x, y, s, prop, angle*)

**draw\_path** (*self, gc, path, transform, rgbFace=None*)

Draw a *Path* instance using the given affine transform.

**draw\_path\_collection** (*self, gc, master\_transform, paths, all\_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset\_position*)

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

**draw\_tex** (*self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None*)

**draw\_text** (*self, gc, x, y, s, prop, angle, ismath=False, mtext=None*)

Draw the text instance.

### Parameters

**gc**

[*GraphicsContextBase*] The graphics context.

**x**

[float] The x location of the text in display coords.

**y**

[float] The y location of the text baseline in display coords.

**s**

[str] The text string.

**prop**

[*matplotlib.font\_manager.FontProperties*] The font properties.

**angle**

[float] The rotation angle in degrees anti-clockwise.

**mtext**

[*matplotlib.text.Text*] The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

**encode\_string**(*self*, *s*, *fonttype*)

**finalize**(*self*)

**get\_image\_magnification**(*self*)

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

**property mathtext\_parser**

**merge\_used\_characters**(*self*, \**args*, \*\**kwargs*)

[*Deprecated*]

## Notes

Deprecated since version 3.3:

**new\_gc (self)**

Return an instance of a *GraphicsContextBase*.

**track\_characters (self, \*args, \*\*kwargs)**

[*Deprecated*] Keep track of which characters are required from each font.

## Notes

Deprecated since version 3.3.

**class** matplotlib.backends.backend\_pdf.**Stream**(*id*, *len*, *file*, *extra=None*,  
*png=None*)

Bases: *object*

PDF stream object.

This has no pdfRepr method. Instead, call begin(), then output the contents of the stream by calling write(), and finally call end().

### Parameters

**id**

[int] Object id of the stream.

**len**

[Reference or None] An unused Reference object for the length of the stream;  
None means to use a memory buffer so the length can be inlined.

**file**

[PdfFile] The underlying object to write the stream to.

**extra**

[dict from Name to anything, or None] Extra key-value pairs to include in the  
stream header.

**png**

[dict or None] If the data is already png encoded, the decode parameters.

**compressobj**

**end (self)**

Finalize stream.

**extra**

**file**

**id**

---

```

len
pdfFile
pos
write(self, data)
    Write some data on the stream.

class matplotlib.backends.backend_pdf.Verbatim(x)
Bases: object

    Store verbatim PDF command content for later inclusion in the stream.

pdfRepr(self)
matplotlib.backends.backend_pdf.fill(strings, linelen=75)
    Make one string from sequence of strings, with whitespace in between.

    The whitespace is chosen to form lines of at most linelen characters, if possible.

matplotlib.backends.backend_pdf.pdfRepr(obj)
    Map Python objects to PDF syntax.

```

## 18.10.9 matplotlib.backends.backend\_pgf

```

matplotlib.backends.backend_pgf.FigureCanvas
    alias of matplotlib.backends.backend_pgf.FigureCanvasPgf

class matplotlib.backends.backend_pgf.FigureCanvasPgf(figure=None)
Bases: matplotlib.backend_bases.FigureCanvasBase

draw(self)
    Render the Figure.

    It is important that this method actually walk the artist tree even if not output is produced because
    this will trigger deferred work (like computing limits auto-limits and tick values) that users may
    want access to before saving to disk.

filetypes = {'pdf': 'LaTeX compiled PGF picture', 'pgf': 'LaTeX PGF picture',
get_default_filetype(self)
    Return the default savefig file format as specified in rcParams["savefig.format"] (de-
    fault: 'png').

    The returned string does not include a period. This method is overridden in backends that only
    support a single file type.

get_renderer(self)
print_pdf(self, fname_or_fh, *args, metadata=None, **kwargs)
    Use LaTeX to compile a pgf generated figure to pdf.

print_pgf(self, fname_or_fh, *args, **kwargs)
    Output pgf macros for drawing the figure so it can be included and rendered in latex documents.

```

```
print_png(self, fname_or_fh, *args, **kwargs)
    Use LaTeX to compile a pgf figure to pdf and convert it to png.
```

```
class matplotlib.backends.backend_pgf.GraphicsContextPgf(**kwargs)
    Bases: matplotlib.backend_bases.GraphicsContextBase
    [Deprecated]
```

### Notes

Deprecated since version 3.3:

```
exception matplotlib.backends.backend_pgf.LatexError(message,           la-
                                                       tex_output='')
    Bases: Exception
```

```
class matplotlib.backends.backend_pgf.LatexManager
    Bases: object
```

The LatexManager opens an instance of the LaTeX application for determining the metrics of text elements. The LaTeX environment can be modified by setting fonts and/or a custom preamble in `rcParams`.

```
get_width_height_descent(self, text, prop)
    Get the width, total height and descent for a text typeset by the current LaTeX environment.
```

```
latex_stdin_utf8(self)
    [Deprecated]
```

### Notes

Deprecated since version 3.3:

```
class matplotlib.backends.backend_pgf.PdfPages(filename,           *,
                                               keep_empty=True,      meta-
                                               data=None)
    Bases: object
```

A multi-page PDF file using the pgf backend

### Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

## Parameters

### `filename`

[str or path-like] Plots using `PdfPages.savefig` will be written to a file at this location. Any older file with the same name is overwritten.

### `keep_empty`

[bool, default: True] If set to False, then empty pdf files will be deleted automatically when closed.

### `metadata`

[dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: { 'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome' }.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

### `close(self)`

Finalize this object, running LaTeX in a temporary directory and moving the final pdf file to `filename`.

### `get_pagecount(self)`

Return the current number of pages in the multipage pdf file.

### `keep_empty`

### `property metadata`

### `savefig(self, figure=None, **kwargs)`

Save a `Figure` to this file as a new page.

Any other keyword arguments are passed to `savefig`.

## Parameters

### `figure`

[`Figure` or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a `Figure` instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

```
class matplotlib.backends.backend_pgf.RendererPgf(figure, f,
                                                dummy=<deprecated parameter>)
```

Bases: `matplotlib.backend_bases.RendererBase`

Create a new PGF renderer that translates any drawing instruction into text commands to be interpreted in a latex pgfpicture environment.

## Attributes

### figure

[*matplotlib.figure.Figure*] Matplotlib figure to initialize height, width and dpi from.

### fh

[file-like] File handle for the output of the drawing commands.

### draw\_image (self, gc, x, y, im, transform=None)

Draw an RGBA image.

## Parameters

### gc

[*GraphicsContextBase*] A graphics context with clipping information.

### x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

### y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

### im

[(N, M, 4) array-like of np.uint8] An array of RGBA pixels.

### transform

[*matplotlib.transforms.Affine2D*] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an *Affine2D*) *may* be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied *before* translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by *transform*).

### draw\_markers (self, gc, marker\_path, marker\_trans, path, trans, rgbFace=None)

Draw a marker at each of *path*'s vertices (excluding control points).

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

## Parameters

### gc

[*GraphicsContextBase*] The graphics context.

**marker\_trans**

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans**

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

**draw\_path**(*self, gc, path, transform, rgbFace=None*)

Draw a *Path* instance using the given affine transform.

**draw\_tex**(*self, gc, x, y, s, prop, angle, ismath='TeX!', mtext=None*)**draw\_text**(*self, gc, x, y, s, prop, angle, ismath=False, mtext=None*)

Draw the text instance.

**Parameters****gc**

[*GraphicsContextBase*] The graphics context.

**x**

[float] The x location of the text in display coords.

**y**

[float] The y location of the text baseline in display coords.

**s**

[str] The text string.

**prop**

[*matplotlib.font\_manager.FontProperties*] The font properties.

**angle**

[float] The rotation angle in degrees anti-clockwise.

**mtext**

[*matplotlib.text.Text*] The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

#### `flipy(self)`

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

#### `get_canvas_width_height(self)`

Return the canvas width and height in display coords.

#### `get_text_width_height_descent(self, s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with `FontProperties prop`.

#### `option_image_nocomposite(self)`

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

#### `option_scale_image(self)`

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

#### `points_to_pixels(self, points)`

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

## Parameters

### `points`

[float or array-like] a float or a numpy array of float

### Returns

#### Points converted to pixels

```
class matplotlib.backends.backend_pgf.TmpDirCleaner(*args, **kwargs)
Bases: object

[Deprecated]
```

## Notes

Deprecated since version 3.4:

```
static add(tmpdir)
[Deprecated]
```

## Notes

Deprecated since version 3.4:

```
static cleanup_remaining_tmpdirs()
[Deprecated]
```

## Notes

Deprecated since version 3.4:

```
remaining_tmpdirs = {}
```

```
matplotlib.backends.backend_pgf.common_texification(text)
```

Do some necessary and/or useful substitutions for texts to be included in LaTeX documents.

This distinguishes text-mode and math-mode by replacing the math separator \$ with \\(\\ displaystyle %s\\). Escaped math separators (\\\$) are ignored.

The following characters are escaped in text segments: \_^\$%

```
matplotlib.backends.backend_pgf.get_fontsSpec()
```

Build fontspec preamble from rc.

```
matplotlib.backends.backend_pgf.get_preamble()
```

Get LaTeX preamble from rc.

```
matplotlib.backends.backend_pgf.make_pdf_to_png_converter()
```

Return a function that converts a pdf file to a png file.

```
matplotlib.backends.backend_pgf.writeln(fh, line)
```

### 18.10.10 matplotlib.backends.backend\_ps

A PostScript backend, which can produce both PostScript .ps and .eps.

```
matplotlib.backends.backend_ps.FigureCanvas
    alias of matplotlib.backends.backend_ps.FigureCanvasPS

class matplotlib.backends.backend_ps.FigureCanvasPS (figure=None)
    Bases: matplotlib.backend_bases.FigureCanvasBase

draw (self)
    Render the Figure.
    It is important that this method actually walk the artist tree even if no output is produced because
    this will trigger deferred work (like computing limits auto-limits and tick values) that users may
    want access to before saving to disk.

    filetypes = {'eps': 'Encapsulated Postscript', 'ps': 'Postscript'}
    fixed_dpi = 72
    get_default_filetype (self)
        Return the default savefig file format as specified in rcParams["savefig.format"] (de-
        fault: 'png').
        The returned string does not include a period. This method is overridden in backends that only
        support a single file type.

    print_eps (self, outfile, *args, **kwargs)
    print_ps (self, outfile, *args, **kwargs)
class matplotlib.backends.backend_ps.GraphicsContextPS (**kwargs)
    Bases: matplotlib.backend_bases.GraphicsContextBase
    [Deprecated]
```

#### Notes

Deprecated since version 3.4:

```
get_capstyle (self)
    Return the CapStyle.
get_joinstyle (self)
    Return the JoinStyle.

class matplotlib.backends.backend_ps.PsBackendHelper
    Bases: object

class matplotlib.backends.backend_ps.RendererPS (width, height, pswriter, im-
        agedpi=72)
    Bases: matplotlib._backend_pdf_ps.RendererPDFPSBase
```

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles.

```
create_hatch(self, hatch)
draw_gouraud_triangle(self, gc, points, colors, trans)
    Draw a Gouraud-shaded triangle.
```

#### Parameters

##### gc

[*GraphicsContextBase*] The graphics context.

##### points

[(3, 2) array-like] Array of (x, y) points for the triangle.

##### colors

[(3, 4) array-like] RGBA colors for each point of the triangle.

##### transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_gouraud_triangles(self, gc, points, colors, trans)
```

Draw a series of Gouraud triangles.

#### Parameters

##### points

[(N, 3, 2) array-like] Array of N (x, y) points for the triangles.

##### colors

[(N, 3, 4) array-like] Array of N RGBA colors for each point of the triangles.

##### transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_image(self, gc, x, y, im, transform=None)
```

Draw an RGBA image.

#### Parameters

##### gc

[*GraphicsContextBase*] A graphics context with clipping information.

##### x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y**

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im**

[(N, M, 4) array-like of np.uint8] An array of RGBA pixels.

**transform**

[[matplotlib.transforms.Affine2DBase](#)] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an [Affine2DBase](#)) *may* be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override `x` and `y`, and has to be applied *before* translating the result by `x` and `y` (this can be accomplished by adding `x` and `y` to the translation vector defined by `transform`).

**draw\_markers** (*self, gc, marker\_path, marker\_trans, path, trans, rgbFace=None*)

Draw a marker at each of `path`'s vertices (excluding control points).

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

**gc**

[[GraphicsContextBase](#)] The graphics context.

**marker\_trans**

[[matplotlib.transforms.Transform](#)] An affine transform applied to the marker.

**trans**

[[matplotlib.transforms.Transform](#)] An affine transform applied to the path.

**draw\_mathtext** (*self, gc, x, y, s, prop, angle*)

Draw the math text using `matplotlib.mathtext`.

**draw\_path** (*self, gc, path, transform, rgbFace=None*)

Draw a [Path](#) instance using the given affine transform.

**draw\_path\_collection** (*self, gc, master\_transform, paths, all\_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset\_position*)

Draw a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

**draw\_tex** (*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath*=<*deprecated parameter*>, *mtext*=*None*)

**draw\_text** (*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath*=*False*, *mtext*=*None*)

Draw the text instance.

### Parameters

**gc**

[*GraphicsContextBase*] The graphics context.

**x**

[float] The x location of the text in display coords.

**y**

[float] The y location of the text baseline in display coords.

**s**

[str] The text string.

**prop**

[*matplotlib.font\_manager.FontProperties*] The font properties.

**angle**

[float] The rotation angle in degrees anti-clockwise.

**mtext**

[*matplotlib.text.Text*] The original text object to be rendered.

### Notes

#### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

```
get_image_magnification(self)
```

Get the factor by which to magnify images passed to draw\_image. Allows a backend to have images at a different resolution to other artists.

```
property mathtext_parser
```

```
merge_used_characters(self, *args, **kwargs)
```

[*Deprecated*]

## Notes

Deprecated since version 3.3:

```
set_color(self, r, g, b, store=True)
```

```
set_font(self, fontname, fontsize, store=True)
```

```
set_linecap(self, linecap, store=True)
```

```
set_linedash(self, offset, seq, store=True)
```

```
set_linejoin(self, linejoin, store=True)
```

```
set_linewidth(self, linewidth, store=True)
```

```
track_characters(self, *args, **kwargs)
```

[*Deprecated*] Keep track of which characters are required from each font.

## Notes

Deprecated since version 3.3.

```
property used_characters
```

```
matplotlib.backends.backend_ps.convert_psfrags(tmpfile,           psfrags,
                                                font_preamble,         cus-
                                                tom_preamble,          paper_width,
                                                paper_height, orientation)
```

When we want to use the LaTeX backend with postscript, we write PSFrag tags to a temporary postscript file, each one marking a position for LaTeX to render some text. convert\_psfrags generates a LaTeX document containing the commands to convert those tags to text. LaTeX/dvips produces the postscript file that includes the actual text.

```
matplotlib.backends.backend_ps.get_bbox_header(lbry, rotated=False)
```

Return a postscript header string for the given bbox lbry=(l, b, r, t). Optionally, return rotate command.

```
matplotlib.backends.backend_ps.gs_distill(tmpfile, eps=False, ptype='letter',
                                           bbox=None, rotated=False)
```

Use ghostscript's pswrite or epswrite device to distill a file. This yields smaller files without illegal encapsulated postscript operators. The output is low-level, converting text to outlines.

```
matplotlib.backends.backend_ps.pstoeps(tmpfile, bbox=None, rotated=False)
```

Convert the postscript to encapsulated postscript. The bbox of the eps file will be replaced with the given *bbox* argument. If None, original bbox will be used.

---

```
matplotlib.backends.backend_ps.quote_ps_string(s)
```

Quote dangerous characters of S for use in a PostScript string constant.

```
matplotlib.backends.backend_ps.xpdf_distill(tmpfile, eps=False, ptype='letter',
                                             bbox=None, rotated=False)
```

Use ghostscript's ps2pdf and xpdf's/poppler's pdftops to distill a file. This yields smaller files without illegal encapsulated postscript operators. This distiller is preferred, generating high-level postscript output that treats text as text.

**NOTE** These backends are not documented here, to avoid adding a dependency to building the docs.

### 18.10.11 `matplotlib.backends.backend_qt4agg`

### 18.10.12 `matplotlib.backends.backend_qt4cairo`

### 18.10.13 `matplotlib.backends.backend_qt5agg`

### 18.10.14 `matplotlib.backends.backend_qt5cairo`

### 18.10.15 `matplotlib.backends.backend_svg`

```
matplotlib.backends.backend_svg.FigureCanvas
```

alias of `matplotlib.backends.backend_svg.FigureCanvasSVG`

```
class matplotlib.backends.backend_svg.FigureCanvasSVG(figure=None)
```

Bases: `matplotlib.backend_bases.FigureCanvasBase`

```
draw(self)
```

Render the *Figure*.

It is important that this method actually walk the artist tree even if no output is produced because this will trigger deferred work (like computing limits auto-limits and tick values) that users may want access to before saving to disk.

```
filetypes = {'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphi
```

```
fixed_dpi = 72
```

```
get_default_filetype(self)
```

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

```
print_svg(self,filename,*args,**kwargs)
```

#### Parameters

##### filename

[str or path-like or file-like] Output target; if a string, a file will be opened for writing.

**metadata**

[dict[str, Any], optional] Metadata in the SVG file defined as key-value pairs of strings, datetimes, or lists of strings, e.g., {'Creator': 'My software', 'Contributor': ['Me', 'My Friend'], 'Title': 'Awesome'}.

The standard keys and their value types are:

- *str*: 'Coverage', 'Description', 'Format', 'Identifier', 'Language', 'Relation', 'Source', 'Title', and 'Type'.
- *str or list of str*: 'Contributor', 'Creator', 'Keywords', 'Publisher', and 'Rights'.
- *str, date, datetime, or tuple* of same: 'Date'. If a non-*str*, then it will be formatted as ISO 8601.

Values have been predefined for 'Creator', 'Date', 'Format', and 'Type'. They can be removed by setting them to `None`.

Information is encoded as [Dublin Core Metadata](#).

**print\_svgz**(self, filename, \*args, \*\*kwargs)

**class** matplotlib.backends.backend\_svg.RendererSVG(width, height, svgwriter, basename=None, image\_dpi=72, \*, metadata=None)

Bases: `matplotlib.backend_bases.RendererBase`

**close\_group**(self, s)

Close a grouping element with label *s*.

Only used by the SVG renderer.

**draw\_gouraud\_triangle**(self, gc, points, colors, trans)

Draw a Gouraud-shaded triangle.

**Parameters**

**gc**

[[GraphicsContextBase](#)] The graphics context.

**points**

[(3, 2) array-like] Array of (x, y) points for the triangle.

**colors**

[(3, 4) array-like] RGBA colors for each point of the triangle.

**transform**

[[matplotlib.transforms.Transform](#)] An affine transform to apply to the points.

**draw\_gouraud\_triangles** (*self, gc, triangles\_array, colors\_array, transform*)

Draw a series of Gouraud triangles.

#### Parameters

##### points

[ $(N, 3, 2)$  array-like] Array of  $N$  (x, y) points for the triangles.

##### colors

[ $(N, 3, 4)$  array-like] Array of  $N$  RGBA colors for each point of the triangles.

##### transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

**draw\_image** (*self, gc, x, y, im, transform=None*)

Draw an RGBA image.

#### Parameters

##### gc

[*GraphicsContextBase*] A graphics context with clipping information.

##### x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

##### y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

##### im

[ $(N, M, 4)$  array-like of `np.uint8`] An array of RGBA pixels.

##### transform

[*matplotlib.transforms.Affine2D*] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an *Affine2D*) *may* be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

**draw\_markers** (*self, gc, marker\_path, marker\_trans, path, trans, rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

#### gc

[*GraphicsContextBase*] The graphics context.

#### marker\_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

#### trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

#### `draw_path(self, gc, path, transform, rgbFace=None)`

Draw a `Path` instance using the given affine transform.

#### `draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)`

Draw a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied.

`offset_position` may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

#### `draw_text(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)`

#### `draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)`

Draw the text instance.

### Parameters

#### gc

[*GraphicsContextBase*] The graphics context.

#### x

[float] The x location of the text in display coords.

**y**

[float] The y location of the text baseline in display coords.

**s**

[str] The text string.

**prop**

[*matplotlib.font\_manager.FontProperties*] The font properties.

**angle**

[float] The rotation angle in degrees anti-clockwise.

**mtext**

[*matplotlib.text.Text*] The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

**finalize(*self*)**

**flipy(*self*)**

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

**get\_canvas\_width\_height(*self*)**

Return the canvas width and height in display coords.

**get\_image\_magnification(*self*)**

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

**get\_text\_width\_height\_descent(*self*, *s*, *prop*, *ismath*)**

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with `FontProperties prop`.

**property mathtext\_parser**

**open\_group(*self*, *s*, *gid=None*)**

Open a grouping element with label *s* and *gid* (if set) as id.

Only used by the SVG renderer.

**option\_image\_nocomposite (self)**

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

**option\_scale\_image (self)**

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

**class** `matplotlib.backends.backend_svg.XMLWriter (file)`

Bases: `object`

**Parameters****file**

[writable text file-like object]

**close (self, id)**

Close open elements, up to (and including) the element identified by the given identifier.

**Parameters****id**

Element identifier, as returned by the `start()` method.

**comment (self, comment)**

Add a comment to the output stream.

**Parameters****comment**

[str] Comment text.

**data (self, text)**

Add character data to the output stream.

**Parameters****text**

[str] Character data.

**element (self, tag, text=None, attrib={}, \*\*extra)**

Add an entire element. This is the same as calling `start()`, `data()`, and `end()` in sequence. The `text` argument can be omitted.

**end (self, tag=None, indent=True)**

Close the current element (opened by the most recent call to `start()`).

## Parameters

### tag

Element tag. If given, the tag must match the start tag. If omitted, the current element is closed.

### flush(*self*)

Flush the output stream.

### start(*self*, *tag*, *attrib*={}, \*\**extra*)

Open a new element. Attributes can be given as keyword arguments, or as a string/string dictionary. The method returns an opaque identifier that can be passed to the [close\(\)](#) method, to close all open elements up to and including this one.

## Parameters

### tag

Element tag.

### attrib

Attribute dictionary. Alternatively, attributes can be given as keyword arguments.

## Returns

An element identifier.

```
matplotlib.backends.backend_svg.escape_attrib(s)
```

```
matplotlib.backends.backend_svg.escape_cdata(s)
```

```
matplotlib.backends.backend_svg.escape_comment(s)
```

```
matplotlib.backends.backend_svg.generate_css(attrib={})
```

```
matplotlib.backends.backend_svg.generate_transform(transform_list=[])
```

```
matplotlib.backends.backend_svg.short_float_fmt(x)
```

Create a short string representation of a float, which is %f formatting with trailing zeros and the decimal point removed.

**18.10.16 matplotlib.backends.backend\_tkagg**

```
matplotlib.backends.backend_tkagg.FigureCanvas
    alias of matplotlib.backends.backend_tkagg.FigureCanvasTkAgg

class matplotlib.backends.backend_tkagg.FigureCanvasTkAgg (figure=None,
    mas-
    ter=None, re-
    size_callback=<deprecated
    parameter>)
```

Bases: *matplotlib.backends.backend\_agg.FigureCanvasAgg*, *matplotlib.backends.\_backend\_tk.FigureCanvasTk*

**blit** (*self, bbox=None*)

Blit the canvas in bbox (default entire canvas).

**draw** (*self*)

Render the *Figure*.

It is important that this method actually walk the artist tree even if not output is produced because this will trigger deferred work (like computing limits auto-limits and tick values) that users may want access to before saving to disk.

**18.10.17 matplotlib.backends.backend\_tkcairo**

```
matplotlib.backends.backend_tkcairo.FigureCanvas
    alias of matplotlib.backends.backend_tkcairo.FigureCanvasTkCairo
```

```
class matplotlib.backends.backend_tkcairo.FigureCanvasTkCairo (*args,
    **kwargs)
```

Bases: *matplotlib.backends.backend\_cairo.FigureCanvasCairo*, *matplotlib.backends.\_backend\_tk.FigureCanvasTk*

**draw** (*self*)

Render the *Figure*.

It is important that this method actually walk the artist tree even if not output is produced because this will trigger deferred work (like computing limits auto-limits and tick values) that users may want access to before saving to disk.

**18.10.18 matplotlib.backends.backend\_webagg**

---

**Note:** The WebAgg backend is not documented here, in order to avoid adding Tornado to the doc build requirements.

---

**NOTE** These backends are not documented here, to avoid adding a dependency to building the docs.

**18.10.19 matplotlib.backends.backend\_wxagg****18.10.20 matplotlib.backends.backend\_wxcairo****18.11 matplotlib.bezier**

A module providing some utility functions regarding Bezier path manipulation.

**class** `matplotlib.bezier.BezierSegment(control_points)`  
 Bases: `object`

A d-dimensional Bezier segment.

**Parameters****control\_points**

[ $(N, d)$  array] Location of the  $N$  control points.

**axis\_aligned\_extrema(self)**

Return the dimension and location of the curve's interior extrema.

The extrema are the points along the curve where one of its partial derivatives is zero.

**Returns****dims**

[array of int] Index  $i$  of the partial derivative which is zero at each interior extrema.

**dzeros**

[array of float] Of same size as dims. The  $t$  such that  $d/dx_i B(t) = 0$

**property control\_points**

The control points of the curve.

**property degree**

Degree of the polynomial. One less the number of control points.

**property dimension**

The dimension of the curve.

**point\_at\_t(self, t)**

Evaluate the curve at a single point, returning a tuple of  $d$  floats.

**property polynomial\_coefficients**

The polynomial coefficients of the Bezier curve.

**Warning:** Follows opposite convention from `numpy.polyval`.

**Returns****(n+1, d) array**

Coefficients after expanding in polynomial basis, where  $n$  is the degree of the bezier curve and  $d$  its dimension. These are the numbers ( $C_j$ ) such that the curve can be written  $\sum_{j=0}^n C_j t^j$ .

**Notes**

The coefficients are calculated as

$$\binom{n}{j} \sum_{i=0}^j (-1)^{i+j} \binom{j}{i} P_i$$

where  $P_i$  are the control points of the curve.

```
exception matplotlib.bezier.NonIntersectingPathException
```

Bases: `ValueError`

```
matplotlib.bezier.check_if_parallel(dx1, dy1, dx2, dy2, tolerance=1e-05)
```

Check if two lines are parallel.

**Parameters****dx1, dy1, dx2, dy2**

[float] The gradients  $dy/dx$  of the two lines.

**tolerance**

[float] The angular tolerance in radians up to which the lines are considered parallel.

**Returns****is\_parallel**

- 1 if two lines are parallel in same direction.
- -1 if two lines are parallel in opposite direction.
- False otherwise.

```
matplotlib.bezier.concatenate_paths(paths)
```

[*Deprecated*] Concatenate a list of paths into a single path.

## Notes

Deprecated since version 3.3.

```
matplotlib.bezier.find_bezier_t_intersecting_with_closedpath(bezier_point_at_t,
                                                               in-
                                                               side_closedpath,
                                                               t0=0.0,
                                                               t1=1.0,
                                                               toler-
                                                               ance=0.01)
```

Find the intersection of the Bezier curve with a closed path.

The intersection point  $t$  is approximated by two parameters  $t0, t1$  such that  $t0 \leq t \leq t1$ .

Search starts from  $t0$  and  $t1$  and uses a simple bisecting algorithm therefore one of the end points must be inside the path while the other doesn't. The search stops when the distance of the points parametrized by  $t0$  and  $t1$  gets smaller than the given *tolerance*.

### Parameters

#### **bezier\_point\_at\_t**

[callable] A function returning x, y coordinates of the Bezier at parameter  $t$ . It must have the signature:

```
bezier_point_at_t(t: float) -> tuple[float, float]
```

#### **inside\_closedpath**

[callable] A function returning True if a given point (x, y) is inside the closed path. It must have the signature:

```
inside_closedpath(point: tuple[float, float]) -> bool
```

#### **t0, t1**

[float] Start parameters for the search.

#### **tolerance**

[float] Maximal allowed distance between the final points.

### Returns

#### **t0, t1**

[float] The Bezier path parameters.

```
matplotlib.bezier.find_control_points(c1x, c1y, mmx, mmy, c2x, c2y)
```

Find control points of the Bezier curve passing through  $(c1x, c1y)$ ,  $(mmx, mmy)$ , and  $(c2x, c2y)$ , at parametric values 0, 0.5, and 1.

```
matplotlib.bezier.get_cos_sin(x0, y0, x1, y1)
```

```
matplotlib.bezier.get_intersection(cx1, cy1, cos_t1, sin_t1, cx2, cy2, cos_t2, sin_t2)
    Return the intersection between the line through (cx1, cy1) at angle t1 and the line through (cx2, cy2) at angle t2.
```

```
matplotlib.bezier.get_normal_points(cx, cy, cos_t, sin_t, length)
    For a line passing through (cx, cy) and having an angle t, return locations of the two points located along its perpendicular line at the distance of length.
```

```
matplotlib.bezier.get_parallel_lines(bezier2, width)
    Given the quadratic Bezier control points bezier2, returns control points of quadratic Bezier lines roughly parallel to given one separated by width.
```

```
matplotlib.bezier.inside_circle(cx, cy, r)
    Return a function that checks whether a point is in a circle with center (cx, cy) and radius r.
```

The returned function has the signature:

```
f(xy: tuple[float, float]) -> bool
```

```
matplotlib.bezier.make_path_regular(p)
```

[Deprecated] If the codes attribute of `Path` p is None, return a copy of p with codes set to (MOVETO, LINETO, LINETO, ..., LINETO); otherwise return p itself.

## Notes

Deprecated since version 3.3.

```
matplotlib.bezier.make_wedged_bezier2(bezier2, width, w1=1.0, wm=0.5, w2=0.0)
```

Being similar to get\_parallel\_lines, returns control points of two quadratic Bezier lines having a width roughly parallel to given one separated by width.

```
matplotlib.bezier.split_bezier_intersecting_with_closedpath(bezier, inside_closedpath,
                                                               tolerance=0.01)
```

Split a Bezier curve into two at the intersection with a closed path.

## Parameters

### bezier

[N, 2] array-like] Control points of the Bezier segment. See [BezierSegment](#).

### inside\_closedpath

[callable] A function returning True if a given point (x, y) is inside the closed path.  
See also [find\\_bezier\\_t\\_intersecting\\_with\\_closedpath](#).

### tolerance

[float] The tolerance for the intersection. See also  
[find\\_bezier\\_t\\_intersecting\\_with\\_closedpath](#).

## Returns

**left, right**

Lists of control points for the two Bezier segments.

`matplotlib.bezier.split_de_casteljau(beta, t)`

Split a Bezier segment defined by its control points *beta* into two separate segments divided at *t* and return their control points.

`matplotlib.bezier.split_path_inout(path, inside, tolerance=0.01, re-`  
`order_inout=False)`

Divide a path into two segments at the point where `inside(x, y)` becomes False.

## 18.12 `matplotlib.blocking_input`

Classes used for blocking interaction with figure windows:

### `BlockingInput`

Creates a callable object to retrieve events in a blocking way for interactive sessions. Base class of the other classes listed here.

### `BlockingKeyMouseInput`

Creates a callable object to retrieve key or mouse clicks in a blocking way for interactive sessions.  
 Used by `waitforbuttonpress`.

### `BlockingMouseInput`

Creates a callable object to retrieve mouse clicks in a blocking way for interactive sessions. Used by `ginput`.

### `BlockingContourLabeler`

Creates a callable object to retrieve mouse clicks in a blocking way that will then be used to place labels on a `ContourSet`. Used by `clabel`.

**class** `matplotlib.blocking_input.BlockingContourLabeler(cs)`

Bases: `matplotlib.blocking_input.BlockingMouseInput`

Callable for retrieving mouse clicks and key presses in a blocking way.

Used to place contour labels.

**add\_click(self, event)**

Add the coordinates of an event to the list of clicks.

### Parameters

#### `event`

[`MouseEvent`]

**button1(self, event)**

Process an button-1 event (add a label to a contour).

**Parameters****event**

[*MouseEvent*]

**button3 (self, event)**

Process an button-3 event (remove a label if not in inline mode).

Unfortunately, if one is doing inline labels, then there is currently no way to fix the broken contour - once humpty-dumpty is broken, he can't be put back together. In inline mode, this does nothing.

**Parameters****event**

[*MouseEvent*]

**pop\_click (self, event, index=-1)**

Remove a click (by default, the last) from the list of clicks.

**Parameters****event**

[*MouseEvent*]

**class matplotlib.blocking\_input.BlockingInput (fig, eventslist=())**

Bases: *object*

Callable for retrieving events in a blocking way.

**add\_event (self, event)**

For base class, this just appends an event to events.

**cleanup (self)**

Disconnect all callbacks.

**on\_event (self, event)**

Event handler; will be passed to the current figure to retrieve events.

**pop (self, index=-1)**

Remove an event from the event list -- by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

**pop\_event (self, index=-1)**

Remove an event from the event list -- by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

**post\_event (self)**

For baseclass, do nothing but collect events.

---

```
class matplotlib.blocking_input.BlockingKeyMouseInput (fig)
Bases: matplotlib.blocking_input.BlockingInput
```

Callable for retrieving mouse clicks and key presses in a blocking way.

**post\_event (self)**

Determine if it is a key event.

```
class matplotlib.blocking_input.BlockingMouseInput (fig,
                                                    mouse_add=<MouseButton.LEFT: 1>,
                                                    mouse_pop=<MouseButton.RIGHT: 3>,
                                                    mouse_stop=<MouseButton.MIDDLE: 2>)
```

Bases: *matplotlib.blocking\_input.BlockingInput*

Callable for retrieving mouse clicks in a blocking way.

This class will also retrieve keypresses and map them to mouse clicks: delete and backspace are a right click, enter is like a middle click, and all others are like a left click.

**add\_click (self, event)**

Add the coordinates of an event to the list of clicks.

#### Parameters

**event**

[*MouseEvent*]

**button\_add = 1**

**button\_pop = 3**

**button\_stop = 2**

**cleanup (self, event=None)**

#### Parameters

**event**

[*MouseEvent*, optional] Not used

**key\_event (self)**

Process a key press event, mapping keys to appropriate mouse clicks.

**mouse\_event (self)**

Process a mouse click event.

**mouse\_event\_add (self, event)**

Process an button-1 event (add a click if inside axes).

#### Parameters

**event**

[*MouseEvent*]

**mouse\_event\_pop**(*self, event*)

Process an button-3 event (remove the last click).

### Parameters

**event**

[*MouseEvent*]

**mouse\_event\_stop**(*self, event*)

Process an button-2 event (end blocking input).

### Parameters

**event**

[*MouseEvent*]

**pop**(*self, event, index=-1*)

Remove a click and the associated event from the list of clicks.

Defaults to the last click.

**pop\_click**(*self, event, index=-1*)

Remove a click (by default, the last) from the list of clicks.

### Parameters

**event**

[*MouseEvent*]

**post\_event**(*self*)

Process an event.

## 18.13 matplotlib.category

Plotting of string "category" data: `plot(['d', 'f', 'a'], [1, 2, 3])` will plot three points with x-axis values of 'd', 'f', 'a'.

See `/gallery/lines_bars_and_markers/categorical_variables` for an example.

The module uses Matplotlib's `matplotlib.units` mechanism to convert from strings to integers and provides a tick locator, a tick formatter, and the `UnitData` class that creates and stores the string-to-integer mapping.

**class** `matplotlib.category.StrCategoryConverter`

Bases: `matplotlib.units.ConversionInterface`

**static axisinfo**(*unit, axis*)  
Set the default axis ticks and labels.

#### Parameters

##### **unit**

[*UnitData*] object string unit information for value

##### **axis**

[*Axis*] axis for which information is being set

#### Returns

##### **AxisInfo**

Information to support default tick labeling

**static convert**(*value, unit, axis*)  
Convert strings in *value* to floats using mapping information stored in the *unit* object.

#### Parameters

##### **value**

[str or iterable] Value or list of values to be converted.

##### **unit**

[*UnitData*] An object mapping strings to integers.

##### **axis**

[*Axis*] The axis on which the converted value is plotted.

---

**Note:** *axis* is unused.

---

#### Returns

##### **float or ndarray[float]**

**static default\_units**(*data, axis*)  
Set and update the *Axis* units.

#### Parameters

##### **data**

[str or iterable of str]

##### **axis**

[*Axis*] axis on which the data is plotted

**Returns*****UnitData***

object storing string to integer mapping

**class** `matplotlib.category.StrCategoryFormatter(units_mapping)`  
Bases: `matplotlib.ticker.Formatter`

String representation of the data at every tick.

**Parameters****units\_mapping**

[dict] Mapping of category names (str) to indices (int).

**format\_ticks(self, values)**

Return the tick labels for all the ticks at once.

**class** `matplotlib.category.StrCategoryLocator(units_mapping)`  
Bases: `matplotlib.ticker.Locator`

Tick at every integer mapping of the string data.

**Parameters****units\_mapping**

[dict] Mapping of category names (str) to indices (int).

**tick\_values(self, vmin, vmax)**

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the **vmin** and **vmax** values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

**class** `matplotlib.category.UnitData(data=None)`

Bases: `object`

Create mapping between unique categorical values and integer ids.

**Parameters****data**

[iterable] sequence of string values

**update** (*self*, *data*)  
Map new values to integer identifiers.

**Parameters****data**

[iterable of str or bytes]

**Raises****TypeError**If elements in *data* are neither str nor bytes.

## 18.14 matplotlib.cbook

A collection of utility functions and classes. Originally, many (but not all) were from the Python Cookbook -- hence the name cbook.

This module is safe to import from anywhere within Matplotlib; it imports Matplotlib only at runtime.

```
class matplotlib.cbook.CallbackRegistry(exception_handler=<function _exception_printer>)
```

Bases: `object`

Handle registering and disconnecting for a set of signals and callbacks:

```
>>> def oneat(x):
...     print('eat', x)
>>> def ondrink(x):
...     print('drink', x)
```

```
>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()
```

```
>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)
```

```
>>> callbacks.process('drink', 123)
drink 123
>>> callbacks.process('eat', 456)
eat 456
>>> callbacks.process('be merry', 456) # nothing will be called
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)      # nothing will be called
```

In practice, one should always disconnect all callbacks when they are no longer needed to avoid dangling references (and thus memory leaks). However, real code in Matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class

of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the `CallbackRegistry` won't keep it alive.

### Parameters

#### `exception_handler`

[callable, optional] If not None, `exception_handler` must be a function that takes an `Exception` as single parameter. It gets called with any `Exception` raised by the callbacks during `CallbackRegistry.process`, and may either re-raise the exception or handle it in another manner.

The default handler prints the exception (with `traceback.print_exc`) if an interactive event loop is running; it re-raises the exception if no interactive event loop is running.

#### `connect (self, signal, func)`

Register `func` to be called when signal `signal` is generated.

#### `disconnect (self, cid)`

Disconnect the callback registered with callback id `cid`.

No error is raised if such a callback does not exist.

#### `process (self, s, *args, **kwargs)`

Process signal `s`.

All of the functions registered to receive callbacks on `s` will be called with `*args` and `**kwargs`.

### `class matplotlib.cbook.Grouper (init=())`

Bases: `object`

A disjoint-set data structure.

Objects can be joined using `join()`, tested for connectedness using `joined()`, and all disjoint sets can be retrieved by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.

## Examples

```
>>> from matplotlib.cbook import Grouper
>>> class Foo:
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
...
>>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
```

(continues on next page)

(continued from previous page)

```
>>> grp.join(d, e)
>>> list(grp)
[[a, b, c], [d, e]]
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False
```

**clean(self)**

Clean dead weak references from the dictionary.

**get\_siblings(self, a)**

Return all of the items joined with *a*, including itself.

**join(self, a, \*args)**

Join given arguments into the same set. Accepts one or more arguments.

**joined(self, a, b)**

Return whether *a* and *b* are members of the same set.

**remove(self, a)****exception matplotlib.cbook.IgnoredKeywordWarning(\*args, \*\*kwargs)**

Bases: `UserWarning`

*[Deprecated]* A class for issuing warnings about keyword arguments that will be ignored by Matplotlib.

## Notes

Deprecated since version 3.3.

**class matplotlib.cbook.Stack(default=None)**

Bases: `object`

Stack of elements with a movable cursor.

Mimics home/back/forward in a web browser.

**back(self)**

Move the position back and return the current element.

**bubble(self, o)**

Raise all references of *o* to the top of the stack, and return it.

## Raises

### ValueError

If *o* is not in the stack.

**clear (self)**

Empty the stack.

**empty (self)**

Return whether the stack is empty.

**forward (self)**

Move the position forward and return the current element.

**home (self)**

Push the first element onto the top of the stack.

The first element is returned.

**push (self, o)**

Push *o* to the stack at current position. Discard all later elements.

*o* is returned.

**remove (self, o)**

Remove *o* from the stack.

**Raises****ValueError**

If *o* is not in the stack.

```
matplotlib.cbook.boxplot_stats(X, whis=1.5, bootstrap=None, labels=None, autorange=False)
```

Return a list of dictionaries of statistics used to draw a series of box and whisker plots using [bxp](#).

**Parameters****X**

[array-like] Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

**whis**

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above  $Q1 - whis * (Q3 - Q1)$ , and the upper whisker at the highest datum below  $Q3 + whis * (Q3 - Q1)$ , where  $Q1$  and  $Q3$  are the first and third quartiles. The default value of `whis` = 1.5 corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data.

In the edge case where  $Q1 == Q3$ , `whis` is automatically set to (0, 100) (cover the whole range of the data) if `autorange` is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

### **bootstrap**

[int, optional] Number of times the confidence intervals around the median should be bootstrapped (percentile method).

### **labels**

[array-like, optional] Labels for each dataset. Length must be compatible with dimensions of  $X$ .

### **autorange**

[bool, optional (False)] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

## Returns

### **list of dict**

A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

Key	Value Description
label	tick label for the boxplot
mean	arithmetic mean value
med	50th percentile
q1	first quartile (25th percentile)
q3	third quartile (75th percentile)
cilo	lower notch around the median
cihi	upper notch around the median
whislo	end of the lower whisker
whishi	end of the upper whisker
fliers	outliers

## Notes

Non-bootstrapping approach to confidence interval uses Gaussian-based asymptotic approximation:

$$\text{med} \pm 1.57 \times \frac{\text{iqr}}{\sqrt{N}}$$

General approach from: McGill, R., Tukey, J.W., and Larsen, W.A. (1978) "Variations of Boxplots", The American Statistician, 32:12-16.

### `matplotlib.cbook.contiguous_regions(mask)`

Return a list of (ind0, ind1) such that `mask[ind0:ind1].all()` is True and we cover all such regions.

```
matplotlib.cbook.delete_masked_points(*args)
```

Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.

Arguments can be in any of 5 categories:

- 1) 1-D masked arrays
- 2) 1-D ndarrays
- 3) ndarrays with more than one dimension
- 4) other non-string iterables
- 5) anything else

The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.

Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if `numpy.isfinite` does not yield a Boolean array.

All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.

A vastly simpler version of this function was originally written as a helper for `Axes.scatter()`.

```
matplotlib.cbook.deprecated(*args, **kwargs)
```

[*Deprecated*]

### Notes

Deprecated since version 3.4:

```
matplotlib.cbook.file_requires_unicode(x)
```

Return whether the given writable file-like object requires Unicode to be written to it.

```
matplotlib.cbook.flatten(seq, scalarp=<function 0x7f27f7f21670>)
```

Return a generator of flattened nested containers.

For example:

```
>>> from matplotlib.cbook import flatten
>>> l = ((['John', ['Hunter']), (1, 23), [[[42, (5, 23)], ]]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett From: <https://code.activestate.com/recipes/121294/> and Recipe 1.12 in cookbook

```
matplotlib.cbook.get_realpath_and_stat(path)
```

[*Deprecated*]

## Notes

Deprecated since version 3.3:

`matplotlib.cbook.get_sample_data(fname, asfileobj=True, *, np_load=False)`

Return a sample data file. `fname` is a path relative to the `mpl-data/sample_data` directory. If `asfileobj` is `True` return a file object, otherwise just a file path.

Sample data files are stored in the '`mpl-data/sample_data`' directory within the Matplotlib package.

If the filename ends in `.gz`, the file is implicitly unzipped. If the filename ends with `.npy` or `.npz`, `asfileobj` is `True`, and `np_load` is `True`, the file is loaded with `numpy.load`. `np_load` currently defaults to `False` but will default to `True` in a future release.

`matplotlib.cbook.index_of(y)`

A helper function to create reasonable x values for the given y.

This is used for plotting (x, y) if x values are not explicitly given.

First try `y.index` (assuming y is a `pandas.Series`), if that fails, use `range(len(y))`.

This will be extended in the future to deal with more types of labeled data.

## Parameters

`y`

[float or array-like]

## Returns

`x, y`

[ndarray] The x and y values to plot.

`matplotlib.cbook.is_math_text(s)`

Return whether the string `s` contains math expressions.

This is done by checking whether `s` contains an even number of non-escaped dollar signs.

`matplotlib.cbook.is_scalar_or_string(val)`

Return whether the given object is a scalar or string like.

`matplotlib.cbook.is_writable_file_like(obj)`

Return whether `obj` looks like a file object with a `write` method.

`matplotlib.cbook.local_over_kwdict(local_var, kwargs, *keys)`

[*Deprecated*] Enforces the priority of a local variable over potentially conflicting argument(s) from a `kwargs` dict. The following possible output values are considered in order of priority:

<code>local_var &gt; kwargs[keys[0]] &gt; ... &gt; kwargs[keys[-1]]</code>
--

The first of these whose value is not `None` will be returned. If all are `None` then `None` will be returned. Each key in `keys` will be removed from the `kwargs` dict in place.

### Parameters

#### **local\_var**

[any object] The local variable (highest priority).

#### **kwargs**

[dict] Dictionary of keyword arguments; modified in place.

#### **keys**

[str(s)] Name(s) of keyword arguments to process, in descending order of priority.

### Returns

#### **any object**

Either local\_var or one of kwargs[key] for key in keys.

### Raises

#### **IgnoredKeywordWarning**

For each key in keys that is removed from kwargs but not used as the output value.

### Notes

Deprecated since version 3.3.

```
matplotlib.cbook.ls_mapper = {'-': 'solid', '--': 'dashed', '-.': 'dashdot', ':': 'dotted'}
```

Maps short codes for line style to their full name used by backends.

```
matplotlib.cbook.ls_mapper_r = {'dashdot': '-.', 'dashed': '--', 'dotted': ':'}
```

Maps full names for line styles used by backends to their short codes.

```
class matplotlib.cbook.maxdict(maxsize)
```

Bases: `dict`

A dictionary with a maximum size.

### Notes

This doesn't override all the relevant methods to constrain the size, just `__setitem__`, so use with caution.

```
matplotlib.cbook.normalize_kwargs(kw, alias_mapping=None, required=<deprecated parameter>, forbidden=<deprecated parameter>, allowed=<deprecated parameter>)
```

Helper function to normalize kwarg inputs.

The order they are resolved are:

1. aliasing
2. required
3. forbidden
4. allowed

This order means that only the canonical names need appear in *allowed*, *forbidden*, *required*.

## Parameters

### **kw**

[dict or None] A dict of keyword arguments. None is explicitly supported and treated as an empty dict, to support functions with an optional parameter of the form `props=None`.

### **alias\_mapping**

[dict or Artist subclass or Artist instance, optional] A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.

If the canonical value is not in the list it is assumed to have the highest priority.

If an Artist subclass or instance is passed, use its properties alias mapping.

### **required**

[list of str, optional] A list of keys that must be in *kws*. This parameter is deprecated.

### **forbidden**

[list of str, optional] A list of keys which may not be in *kw*. This parameter is deprecated.

### **allowed**

[list of str, optional] A list of allowed fields. If this not None, then raise if *kw* contains any keys not in the union of *required* and *allowed*. To allow only the required fields pass in an empty tuple `allowed=()`. This parameter is deprecated.

## Raises

### **TypeError**

To match what python raises if invalid args/kwargs are passed to a callable.

```
matplotlib.cbook.open_file_cm(path_or_file, mode='r', encoding=None)
```

Pass through file objects and context-manage path-likes.

```
matplotlib.cbook.print_cycles(objects, outstream=<_io.TextIOWrapper
                               name='<stdout>' mode='w' encoding='utf-8',
                               show_progress=False)
```

Print loops of cyclic references in the given *objects*.

It is often useful to pass in `gc.garbage` to find the cycles that are preventing some objects from being garbage collected.

### Parameters

#### objects

A list of objects to find cycles in.

#### outstream

The stream for output.

#### show\_progress

[bool] If True, print the number of objects reached as they are found.

```
matplotlib.cbook.pts_to_midstep(x, *args)
```

Convert continuous line to mid-steps.

Given a set of  $N$  points convert to  $2N$  points which when connected linearly give a step function which changes values at the middle of the intervals.

### Parameters

#### x

[array] The x location of the steps. May be empty.

#### y1, ..., yp

[array] y arrays to be turned into steps; all must be the same length as x.

### Returns

#### array

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length  $N$ , each of these arrays will be length  $2N$ .

## Examples

```
>>> x_s, y1_s, y2_s = pts_to_midstep(x, y1, y2)
```

```
matplotlib.cbook.pts_to_poststep(x, *args)
```

Convert continuous line to post-steps.

Given a set of  $N$  points convert to  $2N + 1$  points, which when connected linearly give a step function which changes values at the end of the intervals.

### Parameters

**x**

[array] The x location of the steps. May be empty.

**y1, ..., yp**

[array] y arrays to be turned into steps; all must be the same length as x.

**Returns****array**

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out`, `y1_out`, ..., `yp_out`. If the input is length N, each of these arrays will be length  $2N + 1$ . For  $N=0$ , the length will be 0.

**Examples**

```
>>> x_s, y1_s, y2_s = pts_to_poststep(x, y1, y2)
```

`matplotlib.cbook pts_to_poststep(x, *args)`

Convert continuous line to post-steps.

Given a set of N points, convert to  $2N - 1$  points, which when connected linearly give a step function which changes values at the beginning of the intervals.

**Parameters****x**

[array] The x location of the steps. May be empty.

**y1, ..., yp**

[array] y arrays to be turned into steps; all must be the same length as x.

**Returns****array**

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out`, `y1_out`, ..., `yp_out`. If the input is length N, each of these arrays will be length  $2N + 1$ . For  $N=0$ , the length will be 0.

### Examples

```
>>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)
```

`matplotlib.cbook.report_memory(i=0)`

Return the memory consumed by the process.

`matplotlib.cbook.safe_first_element(obj)`

Return the first element in `obj`.

This is an type-independent way of obtaining the first element, supporting both index access and the iterator protocol.

`matplotlib.cbook.safe_masked_invalid(x, copy=False)`

`matplotlib.cbook.sanitize_sequence(data)`

Convert dictview objects to list. Other inputs are returned unchanged.

`class matplotlib.cbook.silent_list(type, seq=None)`

Bases: `list`

A list with a short `repr()`.

This is meant to be used for a homogeneous list of artists, so that they don't cause long, meaningless output.

Instead of

```
[<matplotlib.lines.Line2D object at 0x7f5749fed3c8>,
 <matplotlib.lines.Line2D object at 0x7f5749fed4e0>,
 <matplotlib.lines.Line2D object at 0x7f5758016550>]
```

one will get

```
<a list of 3 Line2D objects>
```

If `self.type` is `None`, the type name is obtained from the first item in the list (if any).

`matplotlib.cbook.simple_linear_interpolation(a, steps)`

Resample an array with `steps - 1` points between original point pairs.

Along each column of `a`,  $(\text{steps} - 1)$  points are introduced between each original values; the values are linearly interpolated.

#### Parameters

`a`

[array, shape (n, ...)]

`steps`

[int]

#### Returns

---

```

array
    shape ((n - 1) * steps + 1, ...)

matplotlib.cbook.strip_math(s)
    Remove latex formatting from mathtext.

    Only handles fully math and fully non-math strings.

matplotlib.cbook.to_filehandle(fname, flag='r', return_opened=False, encoding=None)
    Convert a path to an open file handle or pass-through a file-like object.

    Consider using open_file_cm instead, as it allows one to properly close newly created file objects more easily.

```

## Parameters

### **fname**

[str or path-like or file-like] If `str` or `os.PathLike`, the file is opened using the flags specified by `flag` and `encoding`. If a file-like object, it is passed through.

### **flag**

[str, default: 'r'] Passed as the `mode` argument to `open` when `fname` is `str` or `os.PathLike`; ignored if `fname` is file-like.

### **return\_opened**

[bool, default: False] If True, return both the file object and a boolean indicating whether this was a new file (that the caller needs to close). If False, return only the new file.

### **encoding**

[str or None, default: None] Passed as the `mode` argument to `open` when `fname` is `str` or `os.PathLike`; ignored if `fname` is file-like.

## Returns

### **fh**

[file-like]

### **opened**

[bool] `opened` is only returned if `return_opened` is True.

```
matplotlib.cbook.violin_stats(X, method, points=100, quantiles=None)
```

Return a list of dictionaries of data which can be used to draw a series of violin plots.

See the Returns section below to view the required keys of the dictionary.

Users can skip this function and pass a user-defined set of dictionaries with the same keys to `vio-linplot` instead of using Matplotlib to do the calculations. See the *Returns* section below for the keys that must be present in the dictionaries.

## Parameters

### X

[array-like] Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.

### method

[callable] The method used to calculate the kernel density estimate for each column of data. When called via `method(v, coords)`, it should return a vector of the values of the KDE evaluated at the values specified in `coords`.

### points

[int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimates at.

### quantiles

[array-like, default: None] Defines (if not None) a list of floats in interval [0, 1] for each column of data, which represents the quantiles that will be rendered for that column of data. Must have 2 or fewer dimensions. 1D array will be treated as a singleton list containing them.

## Returns

### list of dict

A list of dictionaries containing the results for each column of data. The dictionaries contain at least the following:

- coords: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- vals: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in `coords`.
- mean: The mean value for this column of data.
- median: The median value for this column of data.
- min: The minimum value for this column of data.
- max: The maximum value for this column of data.
- quantiles: The quantile values for this column of data.

`matplotlib.cbook.warn_deprecated(*args, **kwargs)`

*[Deprecated]*

## Notes

Deprecated since version 3.4:

## 18.15 matplotlib.cm

Builtin colormaps, colormap handling utilities, and the `ScalarMappable` mixin.

### See also:

[/gallery/color/colormap\\_reference](#) for a list of builtin colormaps.

[Creating Colormaps in Matplotlib](#) for examples of how to make colormaps.

[Choosing Colormaps in Matplotlib](#) an in-depth discussion of choosing colormaps.

[Colormap Normalization](#) for more details about data normalization.

`class matplotlib.cm.ScalarMappable(norm=None, cmap=None)`

Bases: `object`

A mixin class to map scalar data to RGBA.

The `ScalarMappable` applies data normalization before returning RGBA colors from the given colormap.

### Parameters

#### `norm`

[[matplotlib.colors.Normalize](#) (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If `None`, `norm` defaults to a `colors.Normalize` object which initializes its scaling based on the first data processed.

#### `cmap`

[str or [Colormap](#)] The colormap used to map normalized data values to RGBA colors.

`add_checker(self, checker)`

[*Deprecated*]

## Notes

Deprecated since version 3.3:

**autoscale (self)**

Autoscale the scalar limits on the norm instance using the current array

**autoscale\_None (self)**

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**changed (self)**

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**check\_update (self, checker)**

[*Deprecated*]

## Notes

Deprecated since version 3.3:

**colorbar**

The last colorbar associated with this ScalarMappable. May be None.

**get\_alpha (self)****Returns****float**

Always returns 1.

**get\_array (self)**

Return the data array.

**get\_clim (self)**

Return the values (min, max) that are mapped to the colormap limits.

**get\_cmap (self)**

Return the [Colormap](#) instance.

**set\_array (self, A)**

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_clim (self, vmin=None, vmax=None)**

Set the norm limits for image scaling.

## Parameters

### **vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

### **set\_cmap(self, cmap)**

Set the colormap for luminance data.

## Parameters

### **cmap**

[*Colormap* or str or None]

### **set\_norm(self, norm)**

Set the normalization instance.

## Parameters

### **norm**

[*Normalize* or None]

## Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

### **to\_rgba(self, x, alpha=None, bytes=False, norm=True)**

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**property update\_dict**

```
matplotlib.cm.get_cmap(name=None, lut=None)
```

Get a colormap instance, defaulting to rc values if *name* is None.

Colormaps added with `register_cmap()` take precedence over built-in colormaps.

**Parameters****name**

[`matplotlib.colors.Colormap` or str or None, default: None] If a `Colormap` instance, it will be returned. Otherwise, the name of a colormap known to Matplotlib, which will be resampled by *lut*. The default, None, means `rcParams["image.cmap"]` (default: 'viridis').

**lut**

[int or None, default: None] If *name* is not already a Colormap instance and *lut* is not None, the colormap will be resampled to have *lut* entries in the lookup table.

**Notes**

Currently, this returns the global colormap object, which is deprecated. In Matplotlib 3.5, you will no longer be able to modify the global colormaps in-place.

```
matplotlib.cm.register_cmap(name=None, cmap=None, *, override_builtin=False)
```

Add a colormap to the set recognized by `get_cmap()`.

Register a new colormap to be accessed by name

```
LinearSegmentedColormap('swirly', data, lut)
register_cmap(cmap=swirly_cmap)
```

**Parameters****name**

[str, optional] The name that can be used in `get_cmap()` or `rcParams["image.cmap"]` (default: 'viridis')

If absent, the name will be the name attribute of the *cmap*.

**cmap**

[`matplotlib.colors.Colormap`] Despite being the second argument and having a default value, this is a required argument.

**override\_builtin**

[bool] Allow built-in colormaps to be overridden by a user-supplied colormap.

Please do not use this unless you are sure you need it.

## Notes

Registering a colormap stores a reference to the colormap object which can currently be modified and inadvertently change the global colormap state. This behavior is deprecated and in Matplotlib 3.5 the registered colormap will be immutable.

```
matplotlib.cm.unregister_cmap(name)
```

Remove a colormap recognized by `get_cmap()`.

You may not remove built-in colormaps.

If the named colormap is not registered, returns with no error, raises if you try to de-register a default colormap.

**Warning:** Colormap names are currently a shared namespace that may be used by multiple packages. Use `unregister_cmap` only if you know you have registered that name before. In particular, do not unregister just in case to clean the name before registering a new colormap.

## Parameters

### name

[str] The name of the colormap to be un-registered

## Returns

### ColorMap or None

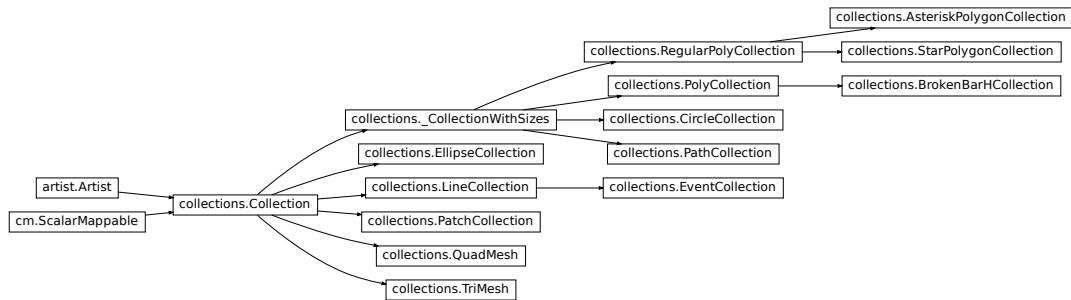

If the colormap was registered, return it if not return `None`

## Raises

### ValueError

If you try to de-register a default built-in colormap.

## 18.16 matplotlib.collections

Classes for the efficient drawing of large collections of objects that share most properties, e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segments).

```
class matplotlib.collections.AsteriskPolygonCollection(numsides, rotation=0, sizes=1, **kwargs)
```

Bases: *matplotlib.collections.RegularPolyCollection*

Draw a collection of regular asterisks with *numsides* points.

### Parameters

#### **numsides**

[int] The number of sides of the polygon.

#### **rotation**

[float] The rotation of the polygon in radians.

#### **sizes**

[tuple of float] The area of the circle circumscribing the polygon in points^2.

#### **\*\*kwargs**

Forwarded to *Collection*.

## Examples

See /gallery/event\_handling/lasso\_demo for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
```

```
collection = RegularPolyCollection(
    numSides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

### `add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

#### Parameters

##### `func`

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

#### Returns

##### `int`

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

#### See also:

[`remove\_callback`](#)

### `add_checker(self, checker)`

[Deprecated]

## Notes

Deprecated since version 3.3:

### **autoscale**(*self*)

Autoscale the scalar limits on the norm instance using the current array

### **autoscale\_None**(*self*)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

### **property axes**

The [Axes](#) instance the artist resides in, or *None*.

### **changed**(*self*)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

### **check\_update**(*self, checker*)

[*Deprecated*]

## Notes

Deprecated since version 3.3:

### **contains**(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

### **convert\_xunits**(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

### **convert\_yunits**(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

### **draw**(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

## Parameters

### **renderer**

[*RendererBase* subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

##### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

##### `include_self`

[bool] Include *self* in the list to be checked for a match.

#### Returns

##### `list of Artist`

### `format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

##### `get_cursor_data`

### `get_agg_filter`(*self*)

Return filter function to be used for agg filter.

### `get_alpha`(*self*)

Return the alpha value used for blending - not supported on all backends.

### `get_animated`(*self*)

Return whether the artist is animated.

**get\_array(self)**  
Return the data array.

**get\_capstyle(self)**

**get\_children(self)**  
Return a list of the child [Artists](#) of this [Artist](#).

**get\_clim(self)**  
Return the values (min, max) that are mapped to the colormap limits.

**get\_clip\_box(self)**  
Return the clipbox.

**get\_clip\_on(self)**  
Return whether the artist uses clipping.

**get\_clip\_path(self)**  
Return the clip path.

**get\_cmap(self)**  
Return the [Colormap](#) instance.

**get\_contains(self)**  
[Deprecated] Return the custom contains function of the artist if set, or *None*.

**See also:**

[`set\_contains`](#)

## Notes

Deprecated since version 3.3.

**get\_cursor\_data(self, event)**  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that [`format\_cursor\_data`](#) can convert the data to a string representation.

The only current use case is displaying the z-value of an [AxesImage](#) in the status bar of a plot window, while moving the mouse.

## Parameters

**event**

[*matplotlib.backend\_bases.MouseEvent*]

See also:

[`format\_cursor\_data`](#)

**get\_dashes**(*self*)

Alias for [`get\_linestyle`](#).

**get\_datalim**(*self, transData*)

**get\_ec**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_edgecolor**(*self*)

**get\_edgecolors**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_facecolor**(*self*)

**get\_facecolors**(*self*)

Alias for [`get\_facecolor`](#).

**get\_fc**(*self*)

Alias for [`get\_facecolor`](#).

**get\_figure**(*self*)

Return the [`Figure`](#) instance the artist belongs to.

**get\_fill**(*self*)

Return whether face is colored.

**get\_gid**(*self*)

Return the group id.

**get\_hatch**(*self*)

Return the current hatching pattern.

**get\_in\_layout**(*self*)

Return boolean flag, True if artist is included in layout calculations.

E.g. [`Constrained Layout Guide`](#), [`Figure.tight\_layout\(\)`](#), and [`fig.savefig\(fname, bbox\_inches='tight'\)`](#).

**get\_joinstyle**(*self*)

**get\_label**(*self*)

Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)

Alias for [`get\_linestyle`](#).

**get\_linewidth**(*self*)

```
get_linewidths(self)
    Alias for get\_linewidth.
```

```
get_ls(self)
    Alias for get\_linestyle.
```

```
get_lw(self)
    Alias for get\_linewidth.
```

```
get_numsides(self)
```

```
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
```

## Notes

Deprecated since version 3.3.

```
get_offset_transform(self)
```

```
get_offsets(self)
    Return the offsets for the collection.
```

```
get_path_effects(self)
```

```
get_paths(self)
```

```
get_picker(self)
    Return the picking behavior of the artist.
```

The possible values are described in [set\\_picker](#).

### See also:

[set\\_picker](#), [pickable](#), [pick](#)

```
get_pickradius(self)
```

```
get_rasterized(self)
    Return whether the artist is to be rasterized.
```

```
get_rotation(self)
```

```
get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.
```

### Returns

**array**

The 'area' of each element.

---

```
get_sketch_params(self)
```

Return the sketch parameters for the artist.

### Returns

#### tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

```
get_snap(self)
```

Return the snap setting.

See [set\\_snap](#) for details.

```
get_tightbbox(self, renderer)
```

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

### Parameters

#### renderer

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

#### Bbox

The enclosing bounding box (in figure pixel coordinates).

```
get_transform(self)
```

Return the [Transform](#) instance used by this artist.

```
get_transformed_clip_path_and_affine(self)
```

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

```
get_transforms(self)
```

```
get_url(self)
```

Return the url.

```
get_urls(self)
```

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

**get\_visible (self)**

Return the visibility.

**get\_window\_extent (self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder (self)**

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

**pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

See also:

`set_picker`, `get_picker`, `pickable`

**pickable**(*self*)

Return whether the artist is pickable.

**See also:**

[`set\_picker`](#), [`get\_picker`](#), [`pick`](#)

**properties**(*self*)

Return a dictionary of all the properties of the artist.

**remove**(*self*)

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with [`FigureCanvasBase.draw\_idle`](#). Call [`relim`](#) to update the axes limits if desired.

Note: [`relim`](#) will not see collections even if the collection was added to the axes with [`autolim`](#) = True.

Note: there is no support for removing the artist's legend entry.

**remove\_callback**(*self, oid*)

Remove a callback based on its observer id.

**See also:**

[`add\_callback`](#)

**set**(*self, \*\*kwargs*)

A property batch setter. Pass *kwargs* to set properties.

**set\_aa**(*self, aa*)

Alias for [`set\_antialiased`](#).

**set\_agg\_filter**(*self, filter\_func*)

Set the agg filter.

**Parameters****filter\_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha**(*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

**Parameters****alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**set\_animated**(*self*, *b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure\*.draw\\_artist](#)/[\*Axes.draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

**Parameters****b**

[bool]

**set\_antialiased**(*self*, *aa*)

Set the antialiasing state for rendering.

**Parameters****aa**

[bool or list of bools]

**set\_antialiaseds**(*self*, *aa*)

Alias for [\*set\\_antialiased\*](#).

**set\_array**(*self*, *A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self*, *cs*)

Set the [\*CapStyle\*](#) for the collection (for all its elements).

**Parameters****cs**

[[\*CapStyle\*](#) or {'butt', 'projecting', 'round'}]

**set\_clim**(*self*, *vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple ( $vmin$ ,  $vmax$ ) as a single positional argument.

**set\_clip\_box**(*self*, *clipbox*)  
Set the artist's clip *Bbox*.

#### Parameters

**clipbox**

[*Bbox*]

**set\_clip\_on**(*self*, *b*)  
Set whether the artist uses clipping.

When *False* artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)  
Set the artist's clip path.

#### Parameters

**path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

#### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap**(*self*, *cmap*)  
Set the colormap for luminance data.

#### Parameters

**cmap**

[*Colormap* or str or None]

**set\_color(*self*, *c*)**

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set\_contains(*self*, *picker*)**

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool,_
    dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes(*self*, *ls*)**

Alias for `set_linenstyle`.

**set\_ec(*self*, *c*)**

Alias for `set_edgecolor`.

**set\_edgecolor**(self, c)

Set the edgecolor(s) of the collection.

**Parameters****c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(self, c)

Alias for [set\\_edgecolor](#).

**set\_facecolor**(self, c)

Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If c is 'none', the patch will not be filled.

**Parameters****c**

[color or list of colors]

**set\_facecolors**(self, c)

Alias for [set\\_facecolor](#).

**set\_fc**(self, c)

Alias for [set\\_facecolor](#).

**set\_figure**(self, fig)

Set the [Figure](#) instance the artist belongs to.

**Parameters****fig**

[[Figure](#)]

**set\_gid**(self, gid)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch**(self, hatch)

Set the hatching pattern

*hatch* can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch**  
[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

**set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide, Figure.](#) [tight\\_layout \(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout**  
[bool]

**set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

**js**  
[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_label (self, s)**

Set a label that will be displayed in the legend.

### Parameters

**s**  
[object] s will be converted to a string by calling `str`.

**set\_linenstyle**(self, ls)

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

### Parameters

#### ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ", (offset, on-off-seq)}. See [Line2D.set\\_linenstyle](#) for a complete description.

**set\_linenstyles**(self, ls)

Alias for [set\\_linenstyle](#).

**set\_linewidth**(self, lw)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

#### lw

[float or list of floats]

**set\_linewidths**(self, lw)

Alias for [set\\_linewidth](#).

**set\_ls**(self, ls)

Alias for [set\\_linenstyle](#).

**set\_lw**(self, lw)

Alias for [set\\_linewidth](#).

**set\_norm**(self, norm)

Set the normalization instance.

### Parameters

#### norm

[*Normalize* or None]

## Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

### **set\_offset\_position** (*self*, *offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

##### **offset\_position**

[{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

### **set\_offsets** (*self*, *offsets*)

Set the offsets for the collection.

#### Parameters

##### **offsets**

[(N, 2) or (2,) array-like]

### **set\_path\_effects** (*self*, *path\_effects*)

Set the path effects.

#### Parameters

##### **path\_effects**

[*AbstractPathEffect*]

### **set\_paths** (*self*)

### **set\_picker** (*self*, *picker*)

Define the picking behavior of the artist.

#### Parameters

##### **picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### `set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

##### `pr`

[float] Pick radius, in points.

### `set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

#### Parameters

##### `rasterized`

[bool]

### `set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

#### Parameters

##### `sizes`

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.

**set\_sketch\_params (self, scale=None, length=None, randomness=None)**

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap (self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform (self, t)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url**(*self, url*)

Set the url for the artist.

**Parameters****url**

[str]

**set\_urls**(*self, urls*)**Parameters****urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_visible**(*self, b*)

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder**(*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `to_rgba` (*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update` (*self*, *props*)

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

### `property update_dict`

### `update_from` (*self*, *other*)

Copy properties from *other* to *self*.

### `update_scalarmappable` (*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

### `zorder = 0`

```
class matplotlib.collections.BrokenBarHCollection(xranges,           yrangle,
                                                **kwargs)
```

Bases: *matplotlib.collections.PolyCollection*

A collection of horizontal bars spanning *yrangle* with a sequence of *xranges*.

#### Parameters

**xranges**

[list of (float, float)] The sequence of (left-edge-position, width) pairs for each bar.

**yrange**

[(float, float)] The (lower-edge, height) common to all bars.

**\*\*kwargs**

Forwarded to [Collection](#).

**add\_callback (self, func)**

Add a callback function that will be called whenever one of the [Artist](#)'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling [Artist](#). Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with [remove\\_callback](#) later.

**See also:**[\*\*remove\\_callback\*\*](#)**add\_checker (self, checker)**

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**autoscale (self)**

Autoscale the scalar limits on the norm instance using the current array

**autoscale\_None (self)**

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**property axes**

The [Axes](#) instance the artist resides in, or *None*.

**changed**(*self*)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**check\_update**(*self, checker*)

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**contains**(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

**convert\_xunits**(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**convert\_yunits**(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**draw**(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters****renderer**

[`RendererBase` subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**findobj**(*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

**Parameters****match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`.  
The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**

[bool] Include *self* in the list to be checked for a match.

**Returns**

**list of *Artist***

**format\_cursor\_data(self, data)**

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:****`get_cursor_data`****`get_agg_filter(self)`**

Return filter function to be used for agg filter.

**`get_alpha(self)`**

Return the alpha value used for blending - not supported on all backends.

**`get_animated(self)`**

Return whether the artist is animated.

**`get_array(self)`**

Return the data array.

**`get_capstyle(self)`****`get_children(self)`**

Return a list of the child *Artists* of this *Artist*.

**`get_clim(self)`**

Return the values (min, max) that are mapped to the colormap limits.

**`get_clip_box(self)`**

Return the clipbox.

**`get_clip_on(self)`**

Return whether the artist uses clipping.

### `get_clip_path(self)`

Return the clip path.

### `get_cmap(self)`

Return the `Colormap` instance.

### `get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or `None`.

See also:

`set_contains`

## Notes

Deprecated since version 3.3.

### `get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

## Parameters

### `event`

[`matplotlib.backend_bases.MouseEvent`]

See also:

`format_cursor_data`

### `get_dashes(self)`

Alias for `get_linestyle`.

### `get_datalim(self, transData)`

### `get_ec(self)`

Alias for `get_edgecolor`.

### `get_edgecolor(self)`

---

```
get_edgecolors(self)
    Alias for get\_edgecolor.
```

```
get_facecolor(self)
```

```
get_facecolors(self)
    Alias for get\_facecolor.
```

```
get_fc(self)
    Alias for get\_facecolor.
```

```
get_figure(self)
    Return the Figure instance the artist belongs to.
```

```
get_fill(self)
    Return whether face is colored.
```

```
get_gid(self)
    Return the group id.
```

```
get_hatch(self)
    Return the current hatching pattern.
```

```
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.

    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').
```

```
get_joinstyle(self)
```

```
get_label(self)
    Return the label used for this artist in the legend.
```

```
get_linestyle(self)
```

```
get_linestyles(self)
    Alias for get\_linestyle.
```

```
get_linewidth(self)
```

```
get_linewidths(self)
    Alias for get\_linewidth.
```

```
get_ls(self)
    Alias for get\_linestyle.
```

```
get_lw(self)
    Alias for get\_linewidth.
```

```
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
```

## Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker, pickable, pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

**Returns**

`array`

The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

**Returns**

`tuple or None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

Returns `None` if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

### `get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

##### `renderer`

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

##### `Bbox`

The enclosing bounding box (in figure pixel coordinates).

### `get_transform(self)`

Return the `Transform` instance used by this artist.

### `get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

### `get_transforms(self)`

### `get_url(self)`

Return the url.

### `get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains `None` for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

### `get_visible(self)`

Return the visibility.

### `get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

### `get_zorder(self)`

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

**pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

`set_picker`, `get_picker`, `pickable`

**pickable (self)**

Return whether the artist is pickable.

See also:

`set_picker`, `get_picker`, `pick`

**properties (self)**

Return a dictionary of all the properties of the artist.

**remove (self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**remove\_callback** (*self*, *oid*)  
Remove a callback based on its observer id.

See also:

[add\\_callback](#)

**set** (*self*, *\*\*kwargs*)  
A property batch setter. Pass *kwargs* to set properties.

**set\_aa** (*self*, *aa*)  
Alias for [set\\_antialiased](#).

**set\_agg\_filter** (*self*, *filter\_func*)  
Set the agg filter.

#### Parameters

**filter\_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha** (*self*, *alpha*)  
Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**set\_animated** (*self*, *b*)  
Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [Figure.draw\\_artist](#) / [Axes.draw\\_artist](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [matplotlib.animation](#) and [Faster rendering by using blitting](#).

#### Parameters

**b**

[bool]

**set\_antialiased** (*self*, *aa*)  
Set the antialiasing state for rendering.

#### Parameters

**aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)

Alias for [set\\_antialiased](#).

**set\_array**(*self, A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self, cs*)

Set the [CapStyle](#) for the collection (for all its elements).

**Parameters****cs**

[[CapStyle](#) or {'butt', 'projecting', 'round'}]

**set\_clim**(*self, vmin=None, vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin, vmax*) as a single positional argument.

**set\_clip\_box**(*self, clipbox*)

Set the artist's clip [Bbox](#).

**Parameters****clipbox**

[[Bbox](#)]

**set\_clip\_on**(*self, b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b**

[bool]

**set\_clip\_path**(*self, path, transform=None*)

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path, transform*) is also accepted as a single positional parameter.

**set\_cmap**(*self, cmap*)

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or *None*]

**set\_color**(*self, c*)

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

*Collection.set\_facecolor*, *Collection.set\_edgecolor*

For setting the edge or face color individually.

**set\_contains**(*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes**(*self*, *ls*)

Alias for `set_linenstyle`.

**set\_ec**(*self*, *c*)

Alias for `set_edgecolor`.

**set\_edgecolor**(*self*, *c*)

Set the edgecolor(s) of the collection.

**Parameters****c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(*self*, *c*)

Alias for `set_edgecolor`.

**set\_facecolor**(*self*, *c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters**

**c**

[color or list of colors]

**set\_facecolors**(*self, c*)Alias for [set\\_facecolor](#).**set\_fc**(*self, c*)Alias for [set\\_facecolor](#).**set\_figure**(*self, fig*)Set the [Figure](#) instance the artist belongs to.**Parameters****fig**[[Figure](#)]**set\_gid**(*self, gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch**(*self, hatch*)

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch**

[{'/', '\\", '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

**set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters****in\_layout**

[bool]

**set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

**Parameters****js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_label (self, s)**

Set a label that will be displayed in the legend.

**Parameters****s**

[object] s will be converted to a string by calling `str`.

**set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters****ls**

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ''}, (offset, on-off-seq)}. See [`Line2D.set\_linestyle`](#) for a complete description.

**`set_linestyles`(*self*, *ls*)**

Alias for [`set\_linestyle`](#).

**`set_linewidth`(*self*, *lw*)**

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****lw**

[float or list of floats]

**`set_linewidths`(*self*, *lw*)**

Alias for [`set\_linewidth`](#).

**`set_ls`(*self*, *ls*)**

Alias for [`set\_linestyle`](#).

**`set_lw`(*self*, *lw*)**

Alias for [`set\_linewidth`](#).

**`set_norm`(*self*, *norm*)**

Set the normalization instance.

**Parameters****norm**

[[`Normalize`](#) or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**`set_offset_position`(*self*, *offset\_position*)**

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters****`offset_position`**

[{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

### `set_offsets`(*self*, *offsets*)

Set the offsets for the collection.

#### Parameters

##### `offsets`

[(N, 2) or (2,) array-like]

### `set_path_effects`(*self*, *path\_effects*)

Set the path effects.

#### Parameters

##### `path_effects`

[*AbstractPathEffect*]

### `set_paths`(*self*, *verts*, *closed=True*)

Set the vertices of the polygons.

#### Parameters

##### `verts`

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts\_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

##### `closed`

[bool, default: True] Whether the polygon should be closed by adding a CLOSE-POLY connection at the end.

### `set_picker`(*self*, *picker*)

Define the picking behavior of the artist.

#### Parameters

##### `picker`

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse

event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### `set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

##### `pr`

[float] Pick radius, in points.

### `set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

#### Parameters

##### `rasterized`

[bool]

### `set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

#### Parameters

##### `sizes`

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

##### `dpi`

[float, default: 72] The dpi of the canvas.

### `set_sketch_params(self, scale=None, length=None, randomness=None)`

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap(*self, snap*)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform(*self, t*)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url(*self, url*)**

Set the url for the artist.

**Parameters**

**url**

[str]

**set\_urls** (*self*, *urls*)

**Parameters****urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_verts** (*self*, *verts*, *closed*=*True*)

Set the vertices of the polygons.

**Parameters****verts**

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts\_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

**closed**

[bool, default: True] Whether the polygon should be closed by adding a CLOSE-POLY connection at the end.

**set\_verts\_and\_codes** (*self*, *verts*, *codes*)

Initialize vertices with path codes.

**set\_visible** (*self*, *b*)

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder** (*self*, *level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**classmethod `span_where`**(*x*, *ymin*, *ymax*, *where*, *\*\*kwargs*)

Return a [\*BrokenBarHCollection\*](#) that plots horizontal bars from over the regions in *x* where *where* is True. The bars range on the y-axis from *ymin* to *ymax*

*kwargs* are passed on to the collection.

**property `stale`**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property `sticky_edges`**

*x* and *y* sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the *x* and *y* lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**`to_rgba`**(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**`update`**(*self*, *props*)

Update this artist's properties from the dict *props*.

### Parameters

**props**

[dict]

**property update\_dict**

**update\_from**(*self, other*)  
Copy properties from other to self.

**update\_scalarmappable**(*self*)  
Update colors from the scalar mappable array, if any.  
Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

**zorder = 0**

**class** matplotlib.collections.CircleCollection(*sizes, \*\*kwargs*)  
Bases: matplotlib.collections.\_CollectionWithSizes  
A collection of circles, drawn using splines.

**Parameters****sizes**

[float or array-like] The area of each circle in points<sup>^2</sup>.

**\*\*kwargs**

Forwarded to *Collection*.

**add\_callback**(*self, func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

**See also:**

[remove\\_callback](#)

**add\_checker** (*self, checker*)  
[Deprecated]

## Notes

Deprecated since version 3.3:

**autoscale** (*self*)  
Autoscale the scalar limits on the norm instance using the current array

**autoscale\_None** (*self*)  
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**property axes**  
The [Axes](#) instance the artist resides in, or *None*.

**changed** (*self*)  
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**check\_update** (*self, checker*)  
[Deprecated]

## Notes

Deprecated since version 3.3:

**contains** (*self, mouseevent*)  
Test whether the mouse event occurred in the collection.  
Returns bool, dict (ind=itemlist), where every item in itemlist contains the event.

**convert\_xunits** (*self, x*)  
Convert *x* using the unit type of the xaxis.  
If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**convert\_yunits** (*self, y*)  
Convert *y* using the unit type of the yaxis.  
If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**draw** (*self, renderer*)  
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible ([Artist.get\\_visible](#) returns False).

## Parameters

**renderer**  
[[RendererBase](#) subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

##### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

##### `include_self`

[bool] Include *self* in the list to be checked for a match.

#### Returns

##### `list of Artist`

### `format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

##### `get_cursor_data`

### `get_agg_filter`(*self*)

Return filter function to be used for agg filter.

### `get_alpha`(*self*)

Return the alpha value used for blending - not supported on all backends.

### `get_animated`(*self*)

Return whether the artist is animated.

**get\_array**(*self*)  
Return the data array.

**get\_capstyle**(*self*)

**get\_children**(*self*)  
Return a list of the child *Artists* of this *Artist*.

**get\_clim**(*self*)  
Return the values (min, max) that are mapped to the colormap limits.

**get\_clip\_box**(*self*)  
Return the clipbox.

**get\_clip\_on**(*self*)  
Return whether the artist uses clipping.

**get\_clip\_path**(*self*)  
Return the clip path.

**get\_cmap**(*self*)  
Return the *Colormap* instance.

**get\_contains**(*self*)  
[Deprecated] Return the custom contains function of the artist if set, or *None*.

**See also:**

[\*set\\_contains\*](#)

## Notes

Deprecated since version 3.3.

**get\_cursor\_data**(*self, event*)  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

## Parameters

**event**

[*matplotlib.backend\_bases.MouseEvent*]

See also:

[`format\_cursor\_data`](#)

**get\_dashes**(*self*)

Alias for [`get\_linestyle`](#).

**get\_datalim**(*self, transData*)

**get\_ec**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_edgecolor**(*self*)

**get\_edgecolors**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_facecolor**(*self*)

**get\_facecolors**(*self*)

Alias for [`get\_facecolor`](#).

**get\_fc**(*self*)

Alias for [`get\_facecolor`](#).

**get\_figure**(*self*)

Return the [`Figure`](#) instance the artist belongs to.

**get\_fill**(*self*)

Return whether face is colored.

**get\_gid**(*self*)

Return the group id.

**get\_hatch**(*self*)

Return the current hatching pattern.

**get\_in\_layout**(*self*)

Return boolean flag, True if artist is included in layout calculations.

E.g. [`Constrained Layout Guide`](#), [`Figure.tight\_layout\(\)`](#), and [`fig.savefig\(fname, bbox\_inches='tight'\)`](#).

**get\_joinstyle**(*self*)

**get\_label**(*self*)

Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)

Alias for [`get\_linestyle`](#).

**get\_linewidth**(*self*)

**get\_linewidths (self)**Alias for [get\\_linewidth](#).**get\_ls (self)**Alias for [get\\_linestyle](#).**get\_lw (self)**Alias for [get\\_lineWidth](#).**get\_offset\_position (self)**

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform (self)****get\_offsets (self)**

Return the offsets for the collection.

**get\_path\_effects (self)****get\_paths (self)****get\_picker (self)**

Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).**See also:**[set\\_picker](#), [pickable](#), [pick](#)**get\_pickradius (self)****get\_rasterized (self)**

Return whether the artist is to be rasterized.

**get\_sizes (self)**

Return the sizes ('areas') of the elements in the collection.

## Returns

**array**

The 'area' of each element.

**get\_sketch\_params (self)**

Return the sketch parameters for the artist.

## Returns

### **tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

### **get\_snap(self)**

Return the snap setting.

See [set\\_snap](#) for details.

### **get\_tightbbox(self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

## Parameters

### **renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

## Returns

### **Bbox**

The enclosing bounding box (in figure pixel coordinates).

### **get\_transform(self)**

Return the [Transform](#) instance used by this artist.

### **get\_transformed\_clip\_path\_and\_affine(self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

### **get\_transforms(self)**

### **get\_url(self)**

Return the url.

### **get\_urls(self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

### **get\_visible(self)**

Return the visibility.

**get\_window\_extent (self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder (self)**

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

**pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

**pickable (self)**

Return whether the artist is pickable.

**See also:**

**`set_picker, get_picker, pick`****`properties (self)`**

Return a dictionary of all the properties of the artist.

**`remove (self)`**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**`remove_callback (self, oid)`**

Remove a callback based on its observer id.

**See also:**

**`add_callback`****`set (self, **kwargs)`**

A property batch setter. Pass `kwargs` to set properties.

**`set_aa (self, aa)`**

Alias for `set_antialiased`.

**`set_agg_filter (self, filter_func)`**

Set the agg filter.

**Parameters****`filter_func`**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**`set_alpha (self, alpha)`**

Set the alpha value used for blending - not supported on all backends.

**Parameters****`alpha`**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**`set_animated (self, b)`**

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call `Figure.draw_artist`/`Axes.draw_artist` explicitly on the artist. This approach is used to speed up animations using blitting.

See also `matplotlib.animation` and *Faster rendering by using blitting*.

### Parameters

#### b

[bool]

### `set_antialiased(self, aa)`

Set the antialiasing state for rendering.

### Parameters

#### aa

[bool or list of bools]

### `set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

### `set_array(self, A)`

Set the image array from numpy array `A`.

### Parameters

#### A

[ndarray or None]

### `set_capstyle(self, cs)`

Set the `CapStyle` for the collection (for all its elements).

### Parameters

#### cs

[`CapStyle` or {'butt', 'projecting', 'round'}]

### `set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

### Parameters

#### vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (`vmin`, `vmax`) as a single positional argument.

---

```
set_clip_box(self, clipbox)
    Set the artist's clip Bbox.
```

#### Parameters

**clipbox**

[*Bbox*]

```
set_clip_on(self, b)
    Set whether the artist uses clipping.
```

When `False` artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b**

[bool]

```
set_clip_path(self, path, transform=None)
    Set the artist's clip path.
```

#### Parameters

**path**

[*Patch* or *Path* or *TransformedPath* or `None`] The clip path. If given a *Path*, *transform* must be provided as well. If `None`, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

```
set_cmap(self, cmap)
    Set the colormap for luminance data.
```

#### Parameters

**cmap**

[*Colormap* or str or `None`]

**set\_color**(*self, c*)

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

[\*Collection.set\\_facecolor\*](#), [\*Collection.set\\_edgecolor\*](#)

For setting the edge or face color individually.

**set\_contains**(*self, picker*)

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default [\*contains\*](#) method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.

The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes**(*self, ls*)

Alias for [\*set\\_linenstyle\*](#).

**set\_ec**(*self, c*)

Alias for [\*set\\_edgecolor\*](#).

**set\_edgecolor**(*self, c*)

Set the edgecolor(s) of the collection.

**Parameters**

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(*self*, *c*)

Alias for [set\\_edgecolor](#).

**set\_facecolor**(*self*, *c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c**

[color or list of colors]

**set\_facecolors**(*self*, *c*)

Alias for [set\\_facecolor](#).

**set\_fc**(*self*, *c*)

Alias for [set\\_facecolor](#).

**set\_figure**(*self*, *fig*)

Set the [Figure](#) instance the artist belongs to.

### Parameters

**fig**

[[Figure](#)]

**set\_gid**(*self*, *gid*)

Set the (group) id for the artist.

### Parameters

**gid**

[str]

**set\_hatch**(*self*, *hatch*)

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed

(continues on next page)

(continued from previous page)

x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

#### **hatch**

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

#### **set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

#### **in\_layout**

[bool]

#### **set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

#### **js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

#### **set\_label (self, s)**

Set a label that will be displayed in the legend.

### Parameters

#### **s**

[object] s will be converted to a string by calling `str`.

#### **set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

#### ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', '!', ", (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

`set_linestyles(self, ls)`

Alias for `set_linestyle`.

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

#### lw

[float or list of floats]

`set_linewidths(self, lw)`

Alias for `set_linewidth`.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, lw)`

Alias for `set_linewidth`.

`set_norm(self, norm)`

Set the normalization instance.

### Parameters

#### norm

[`Normalize` or None]

## Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

### **set\_offset\_position** (*self*, *offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

##### **offset\_position**

[{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

### **set\_offsets** (*self*, *offsets*)

Set the offsets for the collection.

#### Parameters

##### **offsets**

[(N, 2) or (2,) array-like]

### **set\_path\_effects** (*self*, *path\_effects*)

Set the path effects.

#### Parameters

##### **path\_effects**

[*AbstractPathEffect*]

### **set\_paths** (*self*)

### **set\_picker** (*self*, *picker*)

Define the picking behavior of the artist.

#### Parameters

##### **picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).

- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### `set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

##### `pr`

[float] Pick radius, in points.

### `set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

#### Parameters

##### `rasterized`

[bool]

### `set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

#### Parameters

##### `sizes`

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.

**set\_sketch\_params (self, scale=None, length=None, randomness=None)**

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap (self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform (self, t)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url**(*self, url*)

Set the url for the artist.

**Parameters****url**

[str]

**set\_urls**(*self, urls*)**Parameters****urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_visible**(*self, b*)

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder**(*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update`(*self*, *props*)

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

### `property update_dict`

### `update_from`(*self*, *other*)

Copy properties from *other* to *self*.

### `update_scalarmappable`(*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

### `zorder = 0`

```
class matplotlib.collections.Collection(edgecolors=None, facecolors=None,
                                         linewidths=None, linestyles='solid',
                                         capstyle=None, joinstyle=None, anti-aliaseds=None, offsets=None, transOffset=None,
                                         norm=None, cmap=None, pickradius=5.0, hatch=None,
                                         urls=None, offset_position=<deprecated parameter>, zorder=1, **kwargs)
```

Bases: *matplotlib.artist.Artist, matplotlib.cm.ScalarMappable*

Base class for Collections. Must be subclassed to be usable.

A Collection represents a sequence of *Patches* that can be drawn more efficiently together than individually. For example, when a single path is being drawn repeatedly at different offsets, the renderer can typically execute a `draw_marker()` call much more efficiently than a series of repeated calls to `draw_path()` with the offsets put in one-by-one.

Most properties of a collection can be configured per-element. Therefore, Collections have "plural" versions of many of the properties of a *Patch* (e.g. `Collection.get_paths` instead of `Patch.get_path`). Exceptions are the `zorder`, `hatch`, `pickradius`, `capstyle` and `joinstyle` properties, which can only be set globally for the whole collection.

Besides these exceptions, all properties can be specified as single values (applying to all elements) or sequences of values. The property of the `i`th element of the collection is:

```
prop[i % len(prop)]
```

Each Collection can optionally be used as its own *ScalarMappable* by passing the `norm` and `cmap` parameters to its constructor. If the Collection's *ScalarMappable* matrix `_A` has been set (via a call to `Collection.set_array`), then at draw time this internal scalar mappable will be used to set the `facecolors` and `edgecolors`, ignoring those that were manually passed in.

## Parameters

### edgecolors

[color or list of colors, default: `rcParams["patch.edgecolor"]`] (default: 'black') Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

### facecolors

[color or list of colors, default: `rcParams["patch.facecolor"]`] (default: 'C0') Face color for each patch making up the collection.

### linewidths

[float or list of floats, default: `rcParams["patch.linewidth"]`] (default: 1.0) Line width for each patch making up the collection.

### linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dash-dot', 'dotted', ':', '--', '-.', ':-']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see [/gallery/lines\\_bars\\_and\\_markers/linestyles](#).

### **capstyle**

[*CapStyle*-like, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. Allowed values are {'butt', 'projecting', 'round'}.

### **joinstyle**

[*JoinStyle*-like, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. Allowed values are {'miter', 'round', 'bevel'}.

### **antialiaseds**

[bool or list of bool, default: `rcParams["patch.antialiased"]`] (default: True) Whether each patch in the collection should be drawn with antialiasing.

### **offsets**

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

### **transOffset**

[*Transform*, default: `IdentityTransform`] A single transform which will be applied to each *offsets* vector before it is used.

### **offset\_position**

[{ {'screen' (default), 'data' (deprecated)} }] If set to 'data' (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

### **norm**

[*Normalize*, optional] Forwarded to `ScalarMappable`. The default of None means that the first draw call will set `vmin` and `vmax` using the minimum and maximum values of the data.

### **cmap**

[*Colormap*, optional] Forwarded to `ScalarMappable`. The default of None will result in `rcParams["image.cmap"]` (default: 'viridis') being used.

### **hatch**

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/',' ','|','-','+', 'x', 'o', 'O', ':', '\*']. See [/gallery/shapes\\_and\\_collections/hatch\\_style\\_reference](#) for the meaning of each hatch type.

**pickradius**

[float, default: 5.0] If `pickradius <= 0`, then `Collection.contains` will return True whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

**urls**

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See /gallery/misc/hyperlinks\_sgskip for examples.

**zorder**

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder\_demo for all defaults and examples.

**add\_callback (self, func)**

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

`remove_callback`

**add\_checker (self, checker)**

[Deprecated]

## Notes

Deprecated since version 3.3:

### **autoscale**(*self*)

Autoscale the scalar limits on the norm instance using the current array

### **autoscale\_None**(*self*)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

### **property axes**

The [Axes](#) instance the artist resides in, or *None*.

### **changed**(*self*)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

### **check\_update**(*self, checker*)

[*Deprecated*]

## Notes

Deprecated since version 3.3:

### **contains**(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

### **convert\_xunits**(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

### **convert\_yunits**(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

### **draw**(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

## Parameters

### **renderer**

[*RendererBase* subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

##### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

##### `include_self`

[bool] Include *self* in the list to be checked for a match.

#### Returns

##### `list of Artist`

### `format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

##### `get_cursor_data`

### `get_agg_filter`(*self*)

Return filter function to be used for agg filter.

### `get_alpha`(*self*)

Return the alpha value used for blending - not supported on all backends.

### `get_animated`(*self*)

Return whether the artist is animated.

**get\_array**(*self*)  
Return the data array.

**get\_capstyle**(*self*)

**get\_children**(*self*)  
Return a list of the child *Artists* of this *Artist*.

**get\_clim**(*self*)  
Return the values (min, max) that are mapped to the colormap limits.

**get\_clip\_box**(*self*)  
Return the clipbox.

**get\_clip\_on**(*self*)  
Return whether the artist uses clipping.

**get\_clip\_path**(*self*)  
Return the clip path.

**get\_cmap**(*self*)  
Return the *Colormap* instance.

**get\_contains**(*self*)  
[Deprecated] Return the custom contains function of the artist if set, or *None*.

**See also:**

[\*set\\_contains\*](#)

## Notes

Deprecated since version 3.3.

**get\_cursor\_data**(*self, event*)  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

## Parameters

**event**

[*matplotlib.backend\_bases.MouseEvent*]

See also:

[`format\_cursor\_data`](#)

**get\_dashes**(*self*)

Alias for [`get\_linestyle`](#).

**get\_datalim**(*self, transData*)

**get\_ec**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_edgecolor**(*self*)

**get\_edgecolors**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_facecolor**(*self*)

**get\_facecolors**(*self*)

Alias for [`get\_facecolor`](#).

**get\_fc**(*self*)

Alias for [`get\_facecolor`](#).

**get\_figure**(*self*)

Return the [`Figure`](#) instance the artist belongs to.

**get\_fill**(*self*)

Return whether face is colored.

**get\_gid**(*self*)

Return the group id.

**get\_hatch**(*self*)

Return the current hatching pattern.

**get\_in\_layout**(*self*)

Return boolean flag, True if artist is included in layout calculations.

E.g. [`Constrained Layout Guide`](#), [`Figure.tight\_layout\(\)`](#), and [`fig.savefig\(fname, bbox\_inches='tight'\)`](#).

**get\_joinstyle**(*self*)

**get\_label**(*self*)

Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)

Alias for [`get\_linestyle`](#).

**get\_linewidth**(*self*)

**get\_linewidths**(*self*)  
Alias for [get\\_linewidth](#).

**get\_ls**(*self*)  
Alias for [get\\_linestyle](#).

**get\_lw**(*self*)  
Alias for [get\\_lineWidth](#).

**get\_offset\_position**(*self*)

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform**(*self*)

**get\_offsets**(*self*)  
Return the offsets for the collection.

**get\_path\_effects**(*self*)

**get\_paths**(*self*)

**get\_picker**(*self*)  
Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).

See also:

[set\\_picker](#), [pickable](#), [pick](#)

**get\_pickradius**(*self*)

**get\_rasterized**(*self*)  
Return whether the artist is to be rasterized.

**get\_sketch\_params**(*self*)  
Return the sketch parameters for the artist.

## Returns

**tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.

- *randomness*: The scale factor by which the length is shrunken or expanded.  
Returns *None* if no sketch parameters were set.

**get\_snap(self)**

Return the snap setting.

See `set_snap` for details.

**get\_tightbbox(self, renderer)**

Like `Artist.get_window_extent`, but includes any clipping.

**Parameters****renderer**

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns****Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform(self)**

Return the `Transform` instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine(self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms(self)****get\_url(self)**

Return the url.

**get\_urls(self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

**get\_visible(self)**

Return the visibility.

**get\_window\_extent(self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing

the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder (self)**

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

**`add_callback`****`remove_callback`****pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

See also:

**`set_picker, get_picker, pickable`****pickable (self)**

Return whether the artist is pickable.

See also:

**`set_picker, get_picker, pick`****properties (self)**

Return a dictionary of all the properties of the artist.

**remove (self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

### `remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

#### `add_callback`

### `set(self, **kwargs)`

A property batch setter. Pass `kwargs` to set properties.

### `set_aa(self, aa)`

Alias for `set_antialiased`.

### `set_agg_filter(self, filter_func)`

Set the agg filter.

#### Parameters

##### `filter_func`

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

### `set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

##### `alpha`

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

### `set_animated(self, b)`

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call `Figure.draw_artist / Axes.draw_artist` explicitly on the artist. This approach is used to speed up animations using blitting.

See also `matplotlib.animation` and `Faster rendering by using blitting`.

#### Parameters

##### `b`

[bool]

**set\_antialiased**(*self, aa*)  
Set the antialiasing state for rendering.

#### Parameters

**aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)  
Alias for [\*set\\_antialiased\*](#).

**set\_array**(*self, A*)  
Set the image array from numpy array *A*.

#### Parameters

**A**

[ndarray or None]

**set\_capstyle**(*self, cs*)  
Set the [\*CapStyle\*](#) for the collection (for all its elements).

#### Parameters

**cs**

[[\*CapStyle\*](#) or {'butt', 'projecting', 'round'}]

**set\_clim**(*self, vmin=None, vmax=None*)  
Set the norm limits for image scaling.

#### Parameters

**vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin, vmax*) as a single positional argument.

**set\_clip\_box**(*self, clipbox*)  
Set the artist's clip [\*Bbox\*](#).

#### Parameters

**clipbox**

[[\*Bbox\*](#)]

**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap**(*self*, *cmap*)

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or None]

**set\_color**(*self*, *c*)

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set\_contains** (*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

#### Parameters

**picker**

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool,  
            ↴dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

#### Notes

Deprecated since version 3.3.

**set\_dashes** (*self*, *ls*)

Alias for `set_linenstyle`.

**set\_ec** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_edgecolor** (*self*, *c*)

Set the edgecolor(s) of the collection.

#### Parameters

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_facecolor**(*self, c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters****c**

[color or list of colors]

**set\_facecolors**(*self, c*)

Alias for [set\\_facecolor](#).

**set\_fc**(*self, c*)

Alias for [set\\_facecolor](#).

**set\_figure**(*self, fig*)

Set the [Figure](#) instance the artist belongs to.

**Parameters****fig**

[[Figure](#)]

**set\_gid**(*self, gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch**(*self, hatch*)

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

#### **hatch**

[{'/', '\\", '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

#### **set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout \(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

#### **in\_layout**

[bool]

#### **set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

#### **js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

#### **set\_label (self, s)**

Set a label that will be displayed in the legend.

### Parameters

#### **s**

[object] *s* will be converted to a string by calling `str`.

#### **set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

#### `ls`

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ","}, (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

#### `set_linestyles(self, ls)`

Alias for `set_linestyle`.

#### `set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

#### `lw`

[float or list of floats]

#### `set_linewidths(self, lw)`

Alias for `set_linewidth`.

#### `set_ls(self, ls)`

Alias for `set_linestyle`.

#### `set_lw(self, lw)`

Alias for `set_linewidth`.

#### `set_norm(self, norm)`

Set the normalization instance.

### Parameters

#### `norm`

[`Normalize` or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

#### `set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position**

```
[{'screen', 'data'}]
```

**Notes**

Deprecated since version 3.3.

**set\_offsets (self, offsets)**

Set the offsets for the collection.

**Parameters****offsets**

```
[(N, 2) or (2,) array-like]
```

**set\_path\_effects (self, path\_effects)**

Set the path effects.

**Parameters****path\_effects**

```
[AbstractPathEffect]
```

**set\_paths (self)****set\_picker (self, picker)**

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sketch\_params**(*self, scale=None, length=None, randomness=None*)

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap**(*self, snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value

on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

### Parameters

#### **snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

#### **set\_transform(self, t)**

Set the artist transform.

### Parameters

#### **t**

[*Transform*]

#### **set\_url(self, url)**

Set the url for the artist.

### Parameters

#### **url**

[str]

#### **set\_urls(self, urls)**

### Parameters

#### **urls**

[list of str or None]

### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

#### **set\_visible(self, b)**

Set the artist's visibility.

### Parameters

**b**

[bool]

**set\_zorder**(*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

*x* and *y* sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the *x* and *y* lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba**(*self, x, alpha=None, bytes=False, norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update**(*self, props*)

Update this artist's properties from the dict *props*.

**Parameters****props**

[dict]

**property update\_dict****update\_from**(*self, other*)

Copy properties from other to self.

**update\_scalarmappable**(*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

**zorder = 0**

**class** matplotlib.collections.EllipseCollection(*widths*, *heights*, *angles*,  
*units='points'*, **\*\*kwargs**)

Bases: *matplotlib.collections.Collection*

A collection of ellipses, drawn using splines.

**Parameters****widths**

[array-like] The lengths of the first axes (e.g., major axis lengths).

**heights**

[array-like] The lengths of second axes.

**angles**

[array-like] The angles of the first axes, degrees CCW from the x-axis.

**units**

[{'points', 'inches', 'dots', 'width', 'height', 'x', 'y', 'xy'}] The units in which majors and minors are given; 'width' and 'height' refer to the dimensions of the axes, while 'x' and 'y' refer to the *offsets* data units. 'xy' differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the *Ellipse* with *axes.transData* as its transform.

**\*\*kwargs**

Forwarded to *Collection*.

**add\_callback**(*self, func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

## Parameters

### func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

## Returns

### int

The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

## See also:

[\*remove\\_callback\*](#)

[\*\*add\\_checker\*\*\(self, checker\)](#)

[*Deprecated*]

## Notes

Deprecated since version 3.3:

[\*\*autoscale\*\*\(self\)](#)

Autoscale the scalar limits on the norm instance using the current array

[\*\*autoscale\\_None\*\*\(self\)](#)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

[\*\*property axes\*\*](#)

The *Axes* instance the artist resides in, or *None*.

[\*\*changed\*\*\(self\)](#)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

[\*\*check\\_update\*\*\(self, checker\)](#)

[*Deprecated*]

## Notes

Deprecated since version 3.3:

### `contains`(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

### `convert_xunits`(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

### `convert_yunits`(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

### `draw`(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).

## Parameters

### `renderer`

[`RendererBase` subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

## Parameters

### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

### `include_self`

[bool] Include *self* in the list to be checked for a match.

## Returns

`list of Artist`

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`

Return whether the artist uses clipping.

`get_clip_path(self)`

Return the clip path.

`get_cmap(self)`

Return the *Colormap* instance.

`get_contains(self)`

[Deprecated] Return the custom contains function of the artist if set, or *None*.

See also:

**`set_contains`**

**Notes**

Deprecated since version 3.3.

**`get_cursor_data(self, event)`**

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

**`event`**

[`matplotlib.backend_bases.MouseEvent`]

**See also:**

**`format_cursor_data`**

**`get_dashes(self)`**

Alias for `get_linestyle`.

**`get_datalim(self, transData)`**

**`get_ec(self)`**

Alias for `get_edgecolor`.

**`get_edgecolor(self)`**

**`get_edgecolors(self)`**

Alias for `get_edgecolor`.

**`get_facecolor(self)`**

**`get_facecolors(self)`**

Alias for `get_facecolor`.

**`get_fc(self)`**

Alias for `get_facecolor`.

**get\_figure(self)**  
Return the *Figure* instance the artist belongs to.

**get\_fill(self)**  
Return whether face is colored.

**get\_gid(self)**  
Return the group id.

**get\_hatch(self)**  
Return the current hatching pattern.

**get\_in\_layout(self)**  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_joinstyle(self)**

**get\_label(self)**  
Return the label used for this artist in the legend.

**get\_linestyle(self)**

**get\_linestyles(self)**  
Alias for `get_linestyle`.

**get\_linewidth(self)**

**get\_linewidths(self)**  
Alias for `get_linewidth`.

**get\_ls(self)**  
Alias for `get_linestyle`.

**get\_lw(self)**  
Alias for `get_linewidth`.

**get\_offset\_position(self)**  
[Deprecated] Return how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform(self)**

**get\_offsets(self)**  
Return the offsets for the collection.

**get\_path\_effects(self)**

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker, pickable, pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

**Returns**

**tuple or None**

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

Returns `None` if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer**

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e.  
`fig.canvas.get_renderer()`)

**Returns**

**Bbox**

The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the `Transform` instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine (self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms (self)****get\_url (self)**

Return the url.

**get\_urls (self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

**get\_visible (self)**

Return the visibility.

**get\_window\_extent (self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder (self)**

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

[`add\_callback`](#)

**`remove_callback`****`pick(self, mouseevent)`**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set\_picker, get\_picker, pickable`

**`pickable(self)`**

Return whether the artist is pickable.

**See also:**

`set\_picker, get\_picker, pick`

**`properties(self)`**

Return a dictionary of all the properties of the artist.

**`remove(self)`**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**`remove_callback(self, oid)`**

Remove a callback based on its observer id.

**See also:**

`add\_callback`

**`set(self, **kwargs)`**

A property batch setter. Pass *kwargs* to set properties.

**`set_aa(self, aa)`**

Alias for `set_antialiased`.

**`set_agg_filter(self, filter_func)`**

Set the agg filter.

### Parameters

**`filter_func`**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha**(*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

**Parameters****alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive.  
Masked values and nans are not supported.

**set\_animated**(*self, b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure.draw\\_artist\*](#)/[\*Axes.draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

**Parameters****b**

[bool]

**set\_antialiased**(*self, aa*)

Set the antialiasing state for rendering.

**Parameters****aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)

Alias for [\*set\\_antialiased\*](#).

**set\_array**(*self, A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self, cs*)

Set the [\*CapStyle\*](#) for the collection (for all its elements).

**Parameters****cs**

[[\*CapStyle\*](#) or {'butt', 'projecting', 'round'}]

**set\_clim**(*self*, *vmin=None*, *vmax=None*)  
Set the norm limits for image scaling.

#### Parameters

##### **vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

**set\_clip\_box**(*self*, *clipbox*)  
Set the artist's clip *Bbox*.

#### Parameters

##### **clipbox**

[*Bbox*]

**set\_clip\_on**(*self*, *b*)  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

##### **b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)  
Set the artist's clip path.

#### Parameters

##### **path**

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

##### **transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

## Notes

For efficiency, if *path* is a `Rectangle` this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

### `set_cmap(self, cmap)`

Set the colormap for luminance data.

#### Parameters

##### `cmap`

[`Colormap` or str or None]

### `set_color(self, c)`

Set both the edgecolor and the facecolor.

#### Parameters

##### `c`

[color or list of rgba tuples]

#### See also:

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

### `set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

#### Parameters

##### `picker`

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

**set\_dashes**(*self*, *ls*)

Alias for [set\\_linenstyle](#).

**set\_ec**(*self*, *c*)

Alias for [set\\_edgecolor](#).

**set\_edgecolor**(*self*, *c*)

Set the edgecolor(s) of the collection.

### Parameters

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(*self*, *c*)

Alias for [set\\_edgecolor](#).

**set\_facecolor**(*self*, *c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c**

[color or list of colors]

**set\_facecolors**(*self*, *c*)

Alias for [set\\_facecolor](#).

**set\_fc**(*self*, *c*)

Alias for [set\\_facecolor](#).

**set\_figure**(*self*, *fig*)

Set the [Figure](#) instance the artist belongs to.

### Parameters

**fig**

[*Figure*]

**set\_gid**(*self*, *gid*)

Set the (group) id for the artist.

### Parameters

**gid**

[str]

**set\_hatch(self, hatch)**

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch**

[{ '/', '\', '|', '-' , '+' , 'x' , 'o' , 'O' , '.', '\*' }]

**set\_in\_layout(self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout**

[bool]

**set\_joinstyle(self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

**js**[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_label**(*self, s*)

Set a label that will be displayed in the legend.

**Parameters****s**

[object] *s* will be converted to a string by calling `str`.

**set\_linestyle**(*self, ls*)

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

`(offset, onoffseq),`

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters****ls**

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ", (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

**set\_linestyles**(*self, ls*)

Alias for `set_linestyle`.

**set\_linewidth**(*self, lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****lw**

[float or list of floats]

**set\_linewidths**(*self, lw*)

Alias for `set_linewidth`.

**set\_ls**(*self, ls*)

Alias for `set_linestyle`.

---

**set\_lw**(*self, lw*)  
Alias for `set_linewidth`.

**set\_norm**(*self, norm*)  
Set the normalization instance.

#### Parameters

##### norm

[`Normalize` or None]

#### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**set\_offset\_position**(*self, offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

##### offset\_position

[{'screen', 'data'}]

#### Notes

Deprecated since version 3.3.

**set\_offsets**(*self, offsets*)  
Set the offsets for the collection.

#### Parameters

##### offsets

[(N, 2) or (2,) array-like]

**set\_path\_effects**(*self, path\_effects*)  
Set the path effects.

#### Parameters

##### path\_effects

[`AbstractPathEffect`]

**set\_paths**(*self*)

**set\_picker**(*self, picker*)

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

---

**set\_sketch\_params** (*self*, *scale=None*, *length=None*, *randomness=None*)  
Set the sketch parameters.

#### Parameters

##### scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

##### length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

##### randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap** (*self*, *snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

##### snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform** (*self*, *t*)

Set the artist transform.

#### Parameters

##### t

[*Transform*]

**set\_url** (*self*, *url*)

Set the url for the artist.

#### Parameters

**url**

[str]

**set\_urls**(*self*, *urls*)

**Parameters**

**urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_visible**(*self*, *b*)

Set the artist's visibility.

**Parameters**

**b**

[bool]

**set\_zorder**(*self*, *level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `to_rgba` (*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update` (*self*, *props*)

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

### `property update_dict`

### `update_from` (*self*, *other*)

Copy properties from *other* to *self*.

### `update_scalarmappable` (*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

### `zorder = 0`

```
class matplotlib.collections.EventCollection(positions, orientation='horizontal', lineoffset=0, linelength=1, linewidth=None, color=None, linestyle='solid', antialiased=None, **kwargs)
```

Bases: *matplotlib.collections.LineCollection*

A collection of locations along a single axis at which an "event" occurred.

The events are given by a 1-dimensional array. They do not have an amplitude and are displayed as parallel lines.

## Parameters

### positions

[1D array-like] Each value is an event.

### orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The sequence of events is plotted along this direction. The marker lines of the single events are along the orthogonal direction.

### lineoffset

[float, default: 0] The offset of the center of the markers from the origin, in the direction orthogonal to *orientation*.

### linelength

[float, default: 1] The total height of the marker (i.e. the marker stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

### linewidth

[float or list thereof, default: `rcParams["lines.linewidth"]`] (default: 1.5) The line width of the event lines, in points.

### color

[color or list of colors, default: `rcParams["lines.color"]`] (default: 'C0') The color of the event lines.

### linestyle

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dash-dot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

(`offset`, `onoffseq`),

where `onoffseq` is an even length tuple of on and off ink in points.

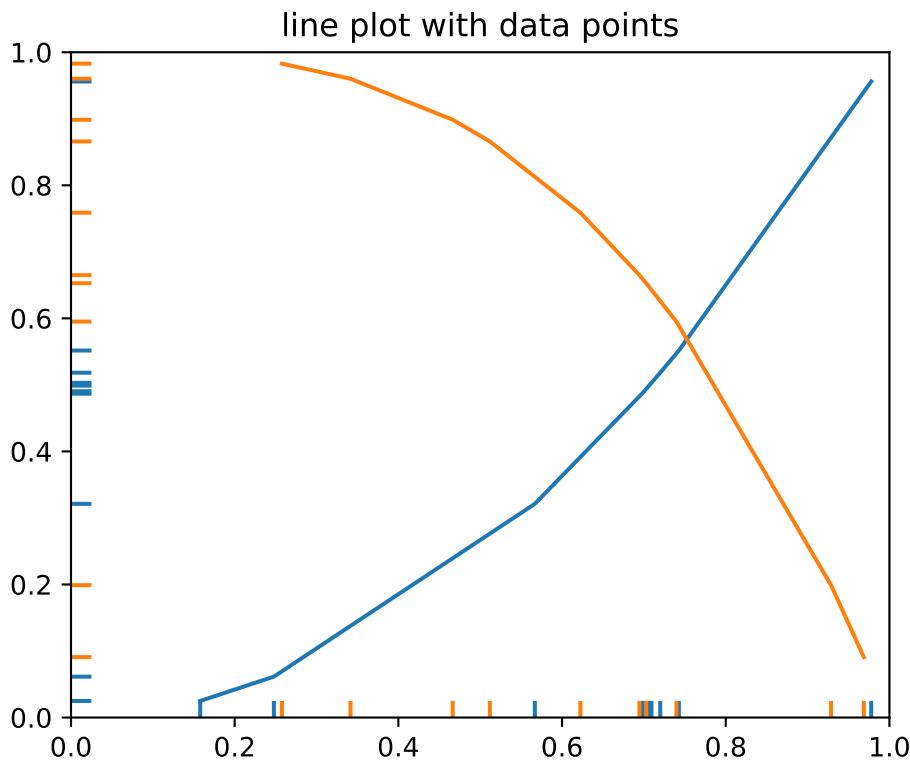

### antialiased

[bool or list thereof, default: `rcParams["lines.antialiased"]`] (default: True) Whether to use antialiasing for drawing the lines.

### \*\*kwargs

Forwarded to `LineCollection`.

## Examples

`add_callback(self, func)`

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

### Parameters

#### func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

### Returns

#### int

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

See also:

**`remove_callback`****`add_checker(self, checker)`**

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**`add_positions(self, position)`**

Add one or more events at the specified positions.

**`append_positions(self, position)`**

Add one or more events at the specified positions.

**`autoscale(self)`**

Autoscale the scalar limits on the norm instance using the current array

**`autoscale_None(self)`**

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are `None`

**`property axes`**

The `Axes` instance the artist resides in, or `None`.

**`changed(self)`**

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**`check_update(self, checker)`**

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**`contains(self, mouseevent)`**

Test whether the mouse event occurred in the collection.

Returns `bool`, `dict(ind=itemlist)`, where every item in itemlist contains the event.

**`convert_xunits(self, x)`**

Convert `x` using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, `x` itself is returned.

**`convert_yunits(self, y)`**

Convert `y` using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, `y` itself is returned.

**draw**(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

**Parameters****renderer**

[*RendererBase* subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**extend\_positions**(*self, position*)

Add one or more events at the specified positions.

**findobj**(*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

**Parameters****match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`.  
The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**

[bool] Include *self* in the list to be checked for a match.

**Returns****list of *Artist*****format\_cursor\_data**(*self, data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

[`get\_cursor\_data`](#)

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child [Artists](#) of this [Artist](#).

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`

Return whether the artist uses clipping.

`get_clip_path(self)`

Return the clip path.

`get_cmap(self)`

Return the [Colormap](#) instance.

`get_color(self)`

Return the color of the lines used to mark each event.

`get_colors(self)`

`get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

[`set\_contains`](#)

## Notes

Deprecated since version 3.3.

`get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

### Parameters

`event`

`[matplotlib.backend_bases.MouseEvent]`

See also:

`format_cursor_data`

`get_dashes(self)`

Alias for `get_linestyle`.

`get_datalim(self, transData)`

`get_ec(self)`

Alias for `get_edgecolor`.

`get_edgecolor(self)`

`get_edgecolors(self)`

Alias for `get_edgecolor`.

`get_facecolor(self)`

`get_facecolors(self)`

Alias for `get_facecolor`.

`get_fc(self)`

Alias for `get_facecolor`.

`get_figure(self)`

Return the `Figure` instance the artist belongs to.

**get\_fill(self)**  
Return whether face is colored.

**get\_gid(self)**  
Return the group id.

**get\_hatch(self)**  
Return the current hatching pattern.

**get\_in\_layout(self)**  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_joinstyle(self)**

**get\_label(self)**  
Return the label used for this artist in the legend.

**get\_linelength(self)**  
Return the length of the lines used to mark each event.

**get\_lineoffset(self)**  
Return the offset of the lines used to mark each event.

**get\_linestyle(self)**

**get\_linestyles(self)**  
Alias for `get_linestyle`.

**get\_linewidth(self)**  
Get the width of the lines used to mark each event.

**get\_linewidths(self)**  
Alias for `get_linewidth`.

**get\_ls(self)**  
Alias for `get_linestyle`.

**get\_lw(self)**  
Alias for `get_linewidth`.

**get\_offset\_position(self)**  
[Deprecated] Return how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_orientation(self)`

Return the orientation of the event line ('horizontal' or 'vertical').

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker, pickable, pick`

`get_pickradius(self)`

`get_positions(self)`

Return an array containing the floating-point values of the positions.

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_segments(self)`

**Returns**

`list`

List of segments in the LineCollection. Each list item contains an array of vertices.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

**Returns**

`tuple or None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap(self)**

Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox(self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

**Parameters****renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns****Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform(self)**

Return the [Transform](#) instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine(self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms(self)****get\_url(self)**

Return the url.

**get\_urls(self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

**get\_visible(self)**

Return the visibility.

**get\_window\_extent(self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can

lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder(*self*)**

Return the artist's zorder.

**have\_units(*self*)**

Return whether units are set on any axis.

**is\_horizontal(*self*)**

True if the eventcollection is horizontal, False if vertical.

**is\_transform\_set(*self*)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged(*self*)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

**`add_callback`****`remove_callback`****pick(*self, mouseevent*)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

**`set_picker, get_picker, pickable`****pickable(*self*)**

Return whether the artist is pickable.

See also:

**`set_picker, get_picker, pick`****properties(*self*)**

Return a dictionary of all the properties of the artist.

### `remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

### `remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

#### `add_callback`

### `set(self, **kwargs)`

A property batch setter. Pass `kwargs` to set properties.

### `set_aa(self, aa)`

Alias for `set_antialiased`.

### `set_agg_filter(self, filter_func)`

Set the agg filter.

#### **Parameters**

##### `filter_func`

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

### `set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### **Parameters**

##### `alpha`

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

### `set_animated(self, b)`

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call `Figure.draw_artist`/`Axes.draw_artist` explicitly on the artist. This approach is used to speed up animations using blitting.

See also `matplotlib.animation` and `Faster rendering by using blitting`.

#### **Parameters**

**b**

[bool]

**set\_antialiased**(*self, aa*)

Set the antialiasing state for rendering.

**Parameters****aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)Alias for `set_antialiased`.**set\_array**(*self, A*)Set the image array from numpy array *A*.**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self, cs*)Set the `CapStyle` for the collection (for all its elements).**Parameters****cs**[`CapStyle` or {'butt', 'projecting', 'round'}]**set\_clim**(*self, vmin=None, vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin, vmax*) as a single positional argument.**set\_clip\_box**(*self, clipbox*)Set the artist's clip `Bbox`.**Parameters****clipbox**[`Bbox`]

**set\_clip\_on(self, b)**

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path(self, path, transform=None)**

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap(self, cmap)**

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or None]

**set\_color(self, c)**

Set the edgecolor(s) of the LineCollection.

**Parameters****c**

[color or list of colors] Single color (all lines have same color), or a sequence of rgba tuples; if it is a sequence the lines will cycle through the sequence.

**set\_colors**(*self, c*)

Set the edgecolor(s) of the LineCollection.

**Parameters****c**

[color or list of colors] Single color (all lines have same color), or a sequence of rgba tuples; if it is a sequence the lines will cycle through the sequence.

**set\_contains**(*self, picker*)

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes**(*self, ls*)

Alias for `set_linenstyle`.

**set\_ec**(*self, c*)

Alias for `set_edgecolor`.

**set\_edgecolor**(*self, c*)

Set the edgecolor(s) of the collection.

**Parameters****c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(*self*, *c*)Alias for [set\\_edgecolor](#).**set\_facecolor**(*self*, *c*)Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.If *c* is 'none', the patch will not be filled.**Parameters****c**

[color or list of colors]

**set\_facecolors**(*self*, *c*)Alias for [set\\_facecolor](#).**set\_fc**(*self*, *c*)Alias for [set\\_facecolor](#).**set\_figure**(*self*, *fig*)Set the [Figure](#) instance the artist belongs to.**Parameters****fig**[*Figure*]**set\_gid**(*self*, *gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch**(*self*, *hatch*)

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

#### **hatch**

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

#### **set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

#### **in\_layout**

[bool]

#### **set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

#### **js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

#### **set\_label (self, s)**

Set a label that will be displayed in the legend.

### Parameters

#### **s**

[object] *s* will be converted to a string by calling `str`.

#### **set\_linenlength (self, linelength)**

Set the length of the lines used to mark each event.

#### **set\_lineoffset (self, lineoffset)**

Set the offset of the lines used to mark each event.

#### **set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

#### ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', '!', ", (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

`set_linestyles(self, ls)`

Alias for `set_linestyle`.

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

#### lw

[float or list of floats]

`set_linewidths(self, lw)`

Alias for `set_linewidth`.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, lw)`

Alias for `set_linewidth`.

`set_norm(self, norm)`

Set the normalization instance.

### Parameters

#### norm

[`Normalize` or None]

## Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

### `set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

##### `offset_position`

[{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

### `set_offsets(self, offsets)`

Set the offsets for the collection.

#### Parameters

##### `offsets`

[(N, 2) or (2,) array-like]

### `set_orientation(self, orientation=None)`

Set the orientation of the event line.

#### Parameters

##### `orientation`

[{'horizontal', 'vertical'}]

### `set_path_effects(self, path_effects)`

Set the path effects.

#### Parameters

##### `path_effects`

[*AbstractPathEffect*]

### `set_paths(self, segments)`

### `set_picker(self, picker)`

Define the picking behavior of the artist.

## Parameters

### **picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

### **set\_pickradius (self, pr)**

Set the pick radius used for containment tests.

## Parameters

### **pr**

[float] Pick radius, in points.

### **set\_positions (self, positions)**

Set the positions of the events.

### **set\_rasterized (self, rasterized)**

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

## Parameters

### **rasterized**

[bool]

---

**set\_segments** (*self, segments*)

**set\_sketch\_params** (*self, scale=None, length=None, randomness=None*)

Set the sketch parameters.

#### Parameters

##### scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

##### length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

##### randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap** (*self, snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

##### snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform** (*self, t*)

Set the artist transform.

#### Parameters

##### t

[*Transform*]

**set\_url** (*self, url*)

Set the url for the artist.

## Parameters

### url

[str]

**set\_urls** (*self*, *urls*)

## Parameters

### urls

[list of str or None]

## Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_verts** (*self*, *segments*)

**set\_visible** (*self*, *b*)

Set the artist's visibility.

## Parameters

### b

[bool]

**set\_zorder** (*self*, *level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

## Parameters

### level

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `switch_orientation(self)`

Switch the orientation of the event line, either from vertical to horizontal or vice versus.

### `to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update(self, props)`

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

##### `property update_dict`

##### `update_from(self, other)`

Copy properties from other to self.

##### `update_scalarmappable(self)`

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

##### `zorder = 0`

```
class matplotlib.collections.LineCollection(segments,      *args,      zorder=2,
                                         **kwargs)
```

Bases: *matplotlib.collections.Collection*

Represents a sequence of *Line2Ds* that should be drawn together.

This class extends *Collection* to represent a sequence of *Line2Ds* instead of just a sequence of *Patches*. Just as in *Collection*, each property of a *LineCollection* may be either a single value or a list of values. This list is then used cyclically for each element of the *LineCollection*, so the property of the  $i$ th element of the collection is:

```
prop[i % len(prop)]
```

The properties of each member of a *LineCollection* default to their values in `rcParams["lines.*"]` instead of `rcParams["patch.*"]`, and the property *colors* is added in place of *edgecolors*.

### Parameters

#### segments

[list of array-like] A sequence of (*line0*, *line1*, *line2*), where:

```
linen = (x0, y0), (x1, y1), ... (xm, ym)
```

or the equivalent numpy array with two columns. Each line can have a different number of segments.

#### linewidths

[float or list of float, default: `rcParams["lines.linewidth"]`] (default: 1.5) The width of each line in points.

#### colors

[color or list of color, default: `rcParams["lines.color"]`] (default: 'C0') A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

#### antialiaseds

[bool or list of bool, default: `rcParams["lines.antialiased"]`] (default: True) Whether to use antialiasing for each line.

#### zorder

[int, default: 2] zorder of the lines once drawn.

#### facecolors

[color or list of color, default: 'none'] When setting *facecolors*, each line is interpreted as a boundary for an area, implicitly closing the path from the last point to the first point. The enclosed area is filled with *facecolor*. In order to manually specify what should count as the "interior" of each line, please use *PathCollection* instead, where the "interior" can be specified by appropriate usage of *CLOSEPOLY*.

#### \*\*kwargs

Forwarded to *Collection*.

**add\_callback**(*self, func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

**See also:**[\*\*remove\\_callback\*\*](#)**add\_checker**(*self, checker*)

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**autoscale**(*self*)

Autoscale the scalar limits on the norm instance using the current array

**autoscale\_None**(*self*)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**property axes**

The *Axes* instance the artist resides in, or *None*.

**changed**(*self*)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**check\_update**(*self, checker*)

[*Deprecated*]

## Notes

Deprecated since version 3.3:

### `contains`(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool`, `dict(ind=itemlist)`, where every item in itemlist contains the event.

### `convert_xunits`(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

### `convert_yunits`(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

### `draw`(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).

## Parameters

### `renderer`

[`RendererBase` subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

## Parameters

### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

### `include_self`

[`bool`] Include *self* in the list to be checked for a match.

## Returns

`list of Artist`

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`

Return whether the artist uses clipping.

`get_clip_path(self)`

Return the clip path.

`get_cmap(self)`

Return the *Colormap* instance.

`get_color(self)`

`get_colors(self)`

### `get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

### `set_contains`

## Notes

Deprecated since version 3.3.

### `get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

## Parameters

### `event`

`[matplotlib.backend_bases.MouseEvent]`

See also:

### `format_cursor_data`

### `get_dashes(self)`

Alias for `get_linestyle`.

### `get_datalim(self, transData)`

### `get_ec(self)`

Alias for `get_edgecolor`.

### `get_edgecolor(self)`

### `get_edgecolors(self)`

Alias for `get_edgecolor`.

### `get_facecolor(self)`

**get\_facecolors**(*self*)  
Alias for [get\\_facecolor](#).

**get\_fc**(*self*)  
Alias for [get\\_facecolor](#).

**get\_figure**(*self*)  
Return the [Figure](#) instance the artist belongs to.

**get\_fill**(*self*)  
Return whether face is colored.

**get\_gid**(*self*)  
Return the group id.

**get\_hatch**(*self*)  
Return the current hatching pattern.

**get\_in\_layout**(*self*)  
Return boolean flag, True if artist is included in layout calculations.  
E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

**get\_joinstyle**(*self*)

**get\_label**(*self*)  
Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)  
Alias for [get\\_linestyle](#).

**get linewidth**(*self*)

**get\_linewidths**(*self*)  
Alias for [get\\_linewidth](#).

**get\_ls**(*self*)  
Alias for [get\\_linestyle](#).

**get\_lw**(*self*)  
Alias for [get\\_linewidth](#).

**get\_offset\_position**(*self*)  
[Deprecated] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform(self)**

**get\_offsets(self)**

Return the offsets for the collection.

**get\_path\_effects(self)**

**get\_paths(self)**

**get\_picker(self)**

Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).

### See also:

[set\\_picker](#), [pickable](#), [pick](#)

**get\_pickradius(self)**

**get\_rasterized(self)**

Return whether the artist is to be rasterized.

**get\_segments(self)**

### Returns

**list**

List of segments in the LineCollection. Each list item contains an array of vertices.

**get\_sketch\_params(self)**

Return the sketch parameters for the artist.

### Returns

**tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap(self)**

Return the snap setting.

See `set_snap` for details.

**get\_tightbbox**(*self, renderer*)

Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer**

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform**(*self*)

Return the `Transform` instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine**(*self*)

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms**(*self*)

**get\_url**(*self*)

Return the url.

**get\_urls**(*self*)

Return a list of URLs, one for each element of the collection.

The list contains `None` for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

**get\_visible**(*self*)

Return the visibility.

**get\_window\_extent**(*self, renderer*)

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder**(*self*)

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

**pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

`set_picker`, `get_picker`, `pickable`

**pickable (self)**

Return whether the artist is pickable.

See also:

`set_picker`, `get_picker`, `pick`

**properties (self)**

Return a dictionary of all the properties of the artist.

**remove (self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**remove\_callback** (*self*, *oid*)  
Remove a callback based on its observer id.

See also:

[\*add\\_callback\*](#)

**set** (*self*, *\*\*kwargs*)  
A property batch setter. Pass *kwargs* to set properties.

**set\_aa** (*self*, *aa*)  
Alias for [\*set\\_antialiased\*](#).

**set\_agg\_filter** (*self*, *filter\_func*)  
Set the agg filter.

#### Parameters

**filter\_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha** (*self*, *alpha*)  
Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**set\_animated** (*self*, *b*)  
Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure.draw\\_artist\*](#) / [\*Axes.draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

#### Parameters

**b**

[bool]

**set\_antialiased** (*self*, *aa*)  
Set the antialiasing state for rendering.

#### Parameters

**aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)

Alias for [set\\_antialiased](#).

**set\_array**(*self, A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self, cs*)

Set the [CapStyle](#) for the collection (for all its elements).

**Parameters****cs**

[[CapStyle](#) or {'butt', 'projecting', 'round'}]

**set\_clim**(*self, vmin=None, vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin, vmax*) as a single positional argument.

**set\_clip\_box**(*self, clipbox*)

Set the artist's clip [Bbox](#).

**Parameters****clipbox**

[[Bbox](#)]

**set\_clip\_on**(*self, b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b**

[bool]

**set\_clip\_path**(*self, path, transform=None*)

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path, transform*) is also accepted as a single positional parameter.

**set\_cmap**(*self, cmap*)

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or *None*]

**set\_color**(*self, c*)

Set the edgecolor(s) of the LineCollection.

**Parameters****c**

[color or list of colors] Single color (all lines have same color), or a sequence of rgba tuples; if it is a sequence the lines will cycle through the sequence.

**set\_colors**(*self, c*)

Set the edgecolor(s) of the LineCollection.

**Parameters**

**c**

[color or list of colors] Single color (all lines have same color), or a sequence of rgba tuples; if it is a sequence the lines will cycle through the sequence.

**set\_contains**(*self*, *picker*)

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default *contains()* implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes**(*self*, *ls*)

Alias for *set\_linenstyle*.

**set\_ec**(*self*, *c*)

Alias for *set\_edgecolor*.

**set\_edgecolor**(*self*, *c*)

Set the edgecolor(s) of the collection.

**Parameters****c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(*self*, *c*)

Alias for *set\_edgecolor*.

**set\_facecolor**(*self, c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters****c**

[color or list of colors]

**set\_facecolors**(*self, c*)

Alias for [set\\_facecolor](#).

**set\_fc**(*self, c*)

Alias for [set\\_facecolor](#).

**set\_figure**(*self, fig*)

Set the [Figure](#) instance the artist belongs to.

**Parameters****fig**

[[Figure](#)]

**set\_gid**(*self, gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch**(*self, hatch*)

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

#### **hatch**

[{'/', '\\", '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

#### **set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout \(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

#### **in\_layout**

[bool]

#### **set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

#### **js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

#### **set\_label (self, s)**

Set a label that will be displayed in the legend.

### Parameters

#### **s**

[object] *s* will be converted to a string by calling `str`.

#### **set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

`(offset, onoffseq),`

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

#### `ls`

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ","}, (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

#### `set_linestyles(self, ls)`

Alias for `set_linestyle`.

#### `set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

#### `lw`

[float or list of floats]

#### `set_linewidths(self, lw)`

Alias for `set_linewidth`.

#### `set_ls(self, ls)`

Alias for `set_linestyle`.

#### `set_lw(self, lw)`

Alias for `set_linewidth`.

#### `set_norm(self, norm)`

Set the normalization instance.

### Parameters

#### `norm`

[`Normalize` or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

#### `set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position**

```
[{'screen', 'data'}]
```

**Notes**

Deprecated since version 3.3.

**set\_offsets (self, offsets)**

Set the offsets for the collection.

**Parameters****offsets**

```
[(N, 2) or (2,) array-like]
```

**set\_path\_effects (self, path\_effects)**

Set the path effects.

**Parameters****path\_effects**

```
[AbstractPathEffect]
```

**set\_paths (self, segments)****set\_picker (self, picker)**

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_segments**(*self, segments*)**set\_sketch\_params**(*self, scale=None, length=None, randomness=None*)

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap**(*self, snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image

would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

### Parameters

#### **snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

#### **set\_transform(self, t)**

Set the artist transform.

### Parameters

#### **t**

[*Transform*]

#### **set\_url(self, url)**

Set the url for the artist.

### Parameters

#### **url**

[str]

#### **set\_urls(self, urls)**

### Parameters

#### **urls**

[list of str or None]

## Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_verts** (*self, segments*)

**set\_visible** (*self, b*)

Set the artist's visibility.

### Parameters

**b**

[bool]

**set\_zorder** (*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba** (*self, x, alpha=None, bytes=False, norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is

either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update** (*self, props*)

Update this artist's properties from the dict *props*.

**Parameters****props**

[dict]

**property update\_dict****update\_from** (*self, other*)

Copy properties from other to self.

**update\_scalarmappable** (*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

**zorder = 0**

**class** `matplotlib.collections.PatchCollection`(*patches*, *match\_original=False*,  
  \*\*kwargs)

Bases: `matplotlib.collections.Collection`

A generic collection of patches.

This makes it easier to assign a colormap to a heterogeneous collection of patches.

This also may improve plotting speed, since PatchCollection will draw faster than a large number of patches.

**patches**

a sequence of Patch objects. This list may include a heterogeneous assortment of different patch types.

**match\_original**

If True, use the colors and linewidths of the original patches. If False, new colors may be assigned by providing the standard collection arguments, facecolor, edgecolor, linewidths, norm or cmap.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are `None`, they default to their `rcParams` patch setting, in sequence form.

The use of `ScalarMappable` functionality is optional. If the `ScalarMappable` matrix `_A` has been set (via a call to `set_array`), at draw time a call to scalar mappable will be made to set the face colors.

### `add_callback(self, func)`

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

#### Parameters

##### `func`

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

#### Returns

##### `int`

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

#### See also:

##### `remove_callback`

### `add_checker(self, checker)`

[*Deprecated*]

#### Notes

Deprecated since version 3.3:

##### `autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

##### `autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are `None`

##### `property axes`

The `Axes` instance the artist resides in, or `None`.

##### `changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**check\_update** (*self, checker*)  
[Deprecated]

## Notes

Deprecated since version 3.3:

**contains** (*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

**convert\_xunits** (*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**convert\_yunits** (*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**draw** (*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

## Parameters

### renderer

[`RendererBase` subclass.]

## Notes

This method is overridden in the Artist subclasses.

**findobj** (*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

## Parameters

### match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**

[bool] Include *self* in the list to be checked for a match.

**Returns**

**list of *Artist***

**format\_cursor\_data(*self*, *data*)**

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

[\*\*get\\_cursor\\_data\*\*](#)

**get\_agg\_filter(*self*)**

Return filter function to be used for agg filter.

**get\_alpha(*self*)**

Return the alpha value used for blending - not supported on all backends.

**get\_animated(*self*)**

Return whether the artist is animated.

**get\_array(*self*)**

Return the data array.

**get\_capstyle(*self*)****get\_children(*self*)**

Return a list of the child *Artists* of this *Artist*.

**get\_clim(*self*)**

Return the values (min, max) that are mapped to the colormap limits.

**get\_clip\_box(*self*)**

Return the clipbox.

**get\_clip\_on(*self*)**

Return whether the artist uses clipping.

**get\_clip\_path(*self*)**

Return the clip path.

**get\_cmap(*self*)**

Return the *Colormap* instance.

### `get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

### `set_contains`

## Notes

Deprecated since version 3.3.

### `get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

## Parameters

### `event`

`[matplotlib.backend_bases.MouseEvent]`

See also:

### `format_cursor_data`

### `get_dashes(self)`

Alias for `get_linestyle`.

### `get_datalim(self, transData)`

### `get_ec(self)`

Alias for `get_edgecolor`.

### `get_edgecolor(self)`

### `get_edgecolors(self)`

Alias for `get_edgecolor`.

### `get_facecolor(self)`

**get\_facecolors**(*self*)  
Alias for [get\\_facecolor](#).

**get\_fc**(*self*)  
Alias for [get\\_facecolor](#).

**get\_figure**(*self*)  
Return the [Figure](#) instance the artist belongs to.

**get\_fill**(*self*)  
Return whether face is colored.

**get\_gid**(*self*)  
Return the group id.

**get\_hatch**(*self*)  
Return the current hatching pattern.

**get\_in\_layout**(*self*)  
Return boolean flag, True if artist is included in layout calculations.  
E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

**get\_joinstyle**(*self*)

**get\_label**(*self*)  
Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)  
Alias for [get\\_linestyle](#).

**get linewidth**(*self*)

**get\_linewidths**(*self*)  
Alias for [get\\_linewidth](#).

**get\_ls**(*self*)  
Alias for [get\\_linestyle](#).

**get\_lw**(*self*)  
Alias for [get\\_linewidth](#).

**get\_offset\_position**(*self*)  
[Deprecated] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform(self)**

**get\_offsets(self)**

Return the offsets for the collection.

**get\_path\_effects(self)**

**get\_paths(self)**

**get\_picker(self)**

Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).

**See also:**

[set\\_picker](#), [pickable](#), [pick](#)

**get\_pickradius(self)**

**get\_rasterized(self)**

Return whether the artist is to be rasterized.

**get\_sketch\_params(self)**

Return the sketch parameters for the artist.

**Returns**

**tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap(self)**

Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox(self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

**Parameters**

**renderer**

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e.  
`fig.canvas.get_renderer()`)

## Returns

### `Bbox`

The enclosing bounding box (in figure pixel coordinates).

### `get_transform(self)`

Return the `Transform` instance used by this artist.

### `get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

### `get_transforms(self)`

### `get_url(self)`

Return the url.

### `get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains `None` for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

### `get_visible(self)`

Return the visibility.

### `get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

### `get_zorder(self)`

Return the artist's zorder.

### `have_units(self)`

Return whether units are set on any axis.

### `is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is `True` after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also [get\\_cursor\\_data\(\)](#), [ToolCursorPosition](#) and [NavigationToolbar2](#).

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

[add\\_callback](#)

[remove\\_callback](#)

**pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

[set\\_picker](#), [get\\_picker](#), [pickable](#)

**pickable (self)**

Return whether the artist is pickable.

See also:

[set\\_picker](#), [get\\_picker](#), [pick](#)

**properties (self)**

Return a dictionary of all the properties of the artist.

**remove (self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with [FigureCanvasBase.draw\\_idle](#). Call [relim](#) to update the axes limits if desired.

Note: [relim](#) will not see collections even if the collection was added to the axes with *autolim* = *True*.

Note: there is no support for removing the artist's legend entry.

**remove\_callback (self, oid)**

Remove a callback based on its observer id.

See also:

[add\\_callback](#)

**set**(*self*, *\*\*kwargs*)

A property batch setter. Pass *kwargs* to set properties.

**set\_aa**(*self*, *aa*)

Alias for [\*set\\_antialiased\*](#).

**set\_agg\_filter**(*self*, *filter\_func*)

Set the agg filter.

**Parameters****filter\_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha**(*self*, *alpha*)

Set the alpha value used for blending - not supported on all backends.

**Parameters****alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**set\_animated**(*self*, *b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure.draw\\_artist\*](#)/[\*Axes.draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

**Parameters****b**

[bool]

**set\_antialiased**(*self*, *aa*)

Set the antialiasing state for rendering.

**Parameters****aa**

[bool or list of bools]

**set\_antialiaseds**(*self*, *aa*)

Alias for [\*set\\_antialiased\*](#).

**set\_array**(*self*, *A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self*, *cs*)

Set the *CapStyle* for the collection (for all its elements).

**Parameters****cs**

[*CapStyle* or {'butt', 'projecting', 'round'}]

**set\_clim**(*self*, *vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

**set\_clip\_box**(*self*, *clipbox*)

Set the artist's clip *Bbox*.

**Parameters****clipbox**

[*Bbox*]

**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters**

**path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap** (*self*, *cmap*)

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or *None*]

**set\_color** (*self*, *c*)

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set\_contains** (*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴  
    dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for `set_linenstyle`.

`set_ec(self, c)`

Alias for `set_edgecolor`.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

### Parameters

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`

Alias for `set_edgecolor`.

`set_facecolor(self, c)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c**

[color or list of colors]

`set_facecolors(self, c)`

Alias for `set_facecolor`.

**set\_fc**(*self, c*)  
 Alias for [set\\_facecolor](#).

**set\_figure**(*self, fig*)  
 Set the [Figure](#) instance the artist belongs to.

#### Parameters

**fig**  
 [*Figure*]

**set\_gid**(*self, gid*)  
 Set the (group) id for the artist.

#### Parameters

**gid**  
 [str]

**set\_hatch**(*self, hatch*)  
 Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch**  
 [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

**set\_in\_layout**(*self, in\_layout*)  
 Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure](#).  
[tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters****in\_layout**

[bool]

**set\_joinstyle (self, js)**Set the [JoinStyle](#) for the collection (for all its elements).**Parameters****js**[[JoinStyle](#) or {'miter', 'round', 'bevel'}]**set\_label (self, s)**

Set a label that will be displayed in the legend.

**Parameters****s**[object] s will be converted to a string by calling [str](#).**set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

**Parameters****ls**[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', " ", (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.**set\_linestyles (self, ls)**Alias for [set\\_linestyle](#).

**set\_linewidth**(*self, lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****lw**

[float or list of floats]

**set\_linewidths**(*self, lw*)

Alias for [set\\_linewidth](#).

**set\_ls**(*self, ls*)

Alias for [set\\_linenstyle](#).

**set\_lw**(*self, lw*)

Alias for [set\\_linewidth](#).

**set\_norm**(*self, norm*)

Set the normalization instance.

**Parameters****norm**

[[Normalize](#) or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**set\_offset\_position**(*self, offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters****offset\_position**

[{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

### `set_offsets` (*self, offsets*)

Set the offsets for the collection.

#### Parameters

##### `offsets`

[ $(N, 2)$  or  $(2,)$  array-like]

### `set_path_effects` (*self, path\_effects*)

Set the path effects.

#### Parameters

##### `path_effects`

[*AbstractPathEffect*]

### `set_paths` (*self, patches*)

### `set_picker` (*self, picker*)

Define the picking behavior of the artist.

#### Parameters

##### `picker`

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sketch\_params**(*self, scale=None, length=None, randomness=None*)

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap**(*self, snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform(*self, t*)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url(*self, url*)**

Set the url for the artist.

**Parameters****url**

[str]

**set\_urls(*self, urls*)****Parameters****urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_visible(*self, b*)**

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder(*self, level*)**

Set the zorder for the artist. Artists with lower zorder values are drawn first.

## Parameters

**level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba (self, x, alpha=None, bytes=False, norm=True)**

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update (self, props)**

Update this artist's properties from the dict *props*.

## Parameters

```
    props
        [dict]

property update_dict
update_from(self, other)
    Copy properties from other to self.

update_scalarmappable(self)
    Update colors from the scalar mappable array, if any.

    Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.PathCollection(paths, sizes=None, **kwargs)
Bases: matplotlib.collections._CollectionWithSizes

A collection of Paths, as created by e.g. scatter.
```

### Parameters

#### paths

[list of *path.Path*] The paths that will make up the *Collection*.

#### sizes

[array-like] The factor by which to scale each drawn *Path*. One unit squared in the Path's data space is scaled to be `sizes**2` points when rendered.

#### \*\*kwargs

Forwarded to *Collection*.

### **add\_callback**(self, func)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

#### func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

#### int

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

See also:

`remove\_callback`

`add\_checker(self, checker)`  
[Deprecated]

## Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale\_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`

The `Axes` instance the artist resides in, or `None`.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check\_update(self, checker)`

[Deprecated]

## Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns `bool`, `dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert\_xunits(self, x)`

Convert `x` using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, `x` itself is returned.

`convert\_yunits(self, y)`

Convert `y` using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, `y` itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get\_visible` returns `False`).

## Parameters

**renderer**

[*RendererBase* subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**findobj** (*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

**Parameters****match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`.  
The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**

[bool] Include *self* in the list to be checked for a match.

**Returns****list of *Artist*****format\_cursor\_data** (*self*, *data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:****get\_cursor\_data****get\_agg\_filter** (*self*)

Return filter function to be used for agg filter.

---

```
get_alpha(self)
    Return the alpha value used for blending - not supported on all backends.

get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.
```

See also:

[\*set\\_contains\*](#)

## Notes

Deprecated since version 3.3.

```
get_cursor_data(self, event)
    Return the cursor data for a given event.
```

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that [\*format\\_cursor\\_data\*](#) can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

### Parameters

#### `event`

[`matplotlib.backend_bases.MouseEvent`]

### See also:

`format_cursor_data`

`get_dashes(self)`

Alias for `get_linenstyle`.

`get_datalim(self, transData)`

`get_ec(self)`

Alias for `get_edgecolor`.

`get_edgecolor(self)`

`get_edgecolors(self)`

Alias for `get_edgecolor`.

`get_facecolor(self)`

`get_facecolors(self)`

Alias for `get_facecolor`.

`get_fc(self)`

Alias for `get_facecolor`.

`get_figure(self)`

Return the `Figure` instance the artist belongs to.

`get_fill(self)`

Return whether face is colored.

`get_gid(self)`

Return the group id.

`get_hatch(self)`

Return the current hatching pattern.

`get_in_layout(self)`

Return boolean flag, True if artist is included in layout calculations.

E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle(self)`

`get_label(self)`

Return the label used for this artist in the legend.

```
get_linestyle(self)
get_linestyles(self)
    Alias for get\_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get\_linewidth.
get_ls(self)
    Alias for get\_linestyle.
get_lw(self)
    Alias for get\_linewidth.
get_offset_position(self)
[Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
```

## Notes

Deprecated since version 3.3.

```
get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
```

The possible values are described in [set\\_picker](#).

### See also:

```
set\_picker, pickable, pick
get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.
```

### Returns

**array**

The 'area' of each element.

**get\_sketch\_params (self)**

Return the sketch parameters for the artist.

**Returns****tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap (self)**

Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox (self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

**Parameters****renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns****Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform (self)**

Return the [Transform](#) instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine (self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms (self)****get\_url (self)**

Return the url.

**get\_urls (self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

**get\_visible (self)**

Return the visibility.

**get\_window\_extent (self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder (self)**

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**legend\_elements (self, prop='colors', num='auto', fmt=None, func=<function PathCollection.<lambda> at 0x7f27ec5558b0>, \*\*kwargs)**

Create legend handles and labels for a PathCollection.

Each legend handle is a `Line2D` representing the Path that was drawn, and each label is a string what each Path represents.

This is useful for obtaining a legend for a `scatter` plot; e.g.:

```
scatter = plt.scatter([1, 2, 3], [4, 5, 6], c=[7, 2, 3])
plt.legend(*scatter.legend_elements())
```

creates three legend elements, one for each color with the numerical values passed to `c` as the labels.

Also see the `automatedlegendcreation` example.

## Parameters

**prop**

[{"colors", "sizes"}, default: "colors"] If "colors", the legend handles will show the different colors of the collection. If "sizes", the legend will show the different sizes. To set both, use *kwargs* to directly edit the [Line2D](#) properties.

**num**

[int, None, "auto" (default), array-like, or [Locator](#)] Target number of elements to create. If None, use all unique elements of the mappable array. If an integer, target to use *num* elements in the normed range. If "auto", try to determine which option better suits the nature of the data. The number of created elements may slightly deviate from *num* due to a [Locator](#) being used to find useful locations. If a list or array, use exactly those elements for the legend. Finally, a [Locator](#) can be provided.

**fmt**

[str, [Formatter](#), or None (default)] The format or formatter to use for the labels. If a string must be a valid input for a [StrMethodFormatter](#). If None (the default), use a [ScalarFormatter](#).

**func**

[function, default: lambda x: x] Function to calculate the labels. Often the size (or color) argument to [scatter](#) will have been pre-processed by the user using a function *s* = *f*(*x*) to make the markers visible; e.g. *size* = np.log10(*x*). Providing the inverse of this function here allows that pre-processing to be inverted, so that the legend labels have the correct values; e.g. *func* = lambda *x*: 10\*\**x*.

**\*\*kwargs**

Allowed keyword arguments are *color* and *size*. E.g. it may be useful to set the color of the markers if *prop="sizes"* is used; similarly to set the size of the markers if *prop="colors"* is used. Any further parameters are passed onto the [Line2D](#) instance. This may be useful to e.g. specify a different *markeredgecolor* or *alpha* for the legend handles.

**Returns****handles**

[list of [Line2D](#)] Visual representation of each element of the legend.

**labels**

[list of str] The string labels for elements of the legend.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also [get\\_cursor\\_data\(\)](#), [ToolCursorPosition](#) and [NavigationToolbar2](#).

**pchanged**(*self*)

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

[`add\_callback`](#)

[`remove\_callback`](#)

**pick**(*self, mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

[`set\_picker, get\_picker, pickable`](#)

**pickable**(*self*)

Return whether the artist is pickable.

See also:

[`set\_picker, get\_picker, pick`](#)

**properties**(*self*)

Return a dictionary of all the properties of the artist.

**remove**(*self*)

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with [`FigureCanvasBase.draw\_idle`](#). Call [`relim`](#) to update the axes limits if desired.

Note: [`relim`](#) will not see collections even if the collection was added to the axes with [`autolim = True`](#).

Note: there is no support for removing the artist's legend entry.

**remove\_callback**(*self, oid*)

Remove a callback based on its observer id.

See also:

[`add\_callback`](#)

**set**(*self, \*\*kwargs*)

A property batch setter. Pass *kwargs* to set properties.

**set\_aa**(*self, aa*)

Alias for [`set\_antialiased`](#).

**set\_agg\_filter**(*self, filter\_func*)  
Set the agg filter.

#### Parameters

##### **filter\_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha**(*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

#### Parameters

##### **alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**set\_animated**(*self, b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure.draw\\_artist\*](#) / [\*Axes.draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

#### Parameters

##### **b**

[bool]

**set\_antialiased**(*self, aa*)

Set the antialiasing state for rendering.

#### Parameters

##### **aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)

Alias for [\*set\\_antialiased\*](#).

**set\_array**(*self, A*)

Set the image array from numpy array *A*.

#### Parameters

**A**

[ndarray or None]

**set\_capstyle**(*self*, *cs*)

Set the *CapStyle* for the collection (for all its elements).

**Parameters****cs**

[*CapStyle* or {'butt', 'projecting', 'round'}]

**set\_clim**(*self*, *vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

**set\_clip\_box**(*self*, *clipbox*)

Set the artist's clip *Bbox*.

**Parameters****clipbox**

[*Bbox*]

**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap** (*self*, *cmap*)

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or *None*]

**set\_color** (*self*, *c*)

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set\_contains** (*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.

The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

**set\_dashes** (*self*, *ls*)

Alias for `set_linenstyle`.

**set\_ec** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_edgecolor** (*self*, *c*)

Set the edgecolor(s) of the collection.

### Parameters

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_facecolor** (*self*, *c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c**

[color or list of colors]

**set\_facecolors** (*self*, *c*)

Alias for `set_facecolor`.

**set\_fc** (*self*, *c*)

Alias for `set_facecolor`.

**set\_figure**(*self, fig*)  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig**  
[*Figure*]

**set\_gid**(*self, gid*)  
Set the (group) id for the artist.

#### Parameters

**gid**  
[str]

**set\_hatch**(*self, hatch*)  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch**  
[{', '\\", '|', '-' , '+' , 'x' , 'o' , 'O' , '.' , '\*'}]

**set\_in\_layout**(*self, in\_layout*)  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout**

[bool]

**set\_joinstyle**(*self, js*)Set the *JoinStyle* for the collection (for all its elements).**Parameters****js**[*JoinStyle* or {'miter', 'round', 'bevel'}]**set\_label**(*self, s*)

Set a label that will be displayed in the legend.

**Parameters****s**[object] *s* will be converted to a string by calling *str*.**set\_linestyle**(*self, ls*)

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where *onoffseq* is an even length tuple of on and off ink in points.**Parameters****ls**[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ", (offset, on-off-seq)}. See *Line2D.set\_linestyle* for a complete description.**set\_linestyles**(*self, ls*)Alias for *set\_linestyle*.**set\_linewidth**(*self, lw*)Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****lw**

[float or list of floats]

**set\_linewidths**(*self, lw*)

Alias for [set\\_linewidth](#).

**set\_ls**(*self, ls*)

Alias for [set\\_linestyle](#).

**set\_lw**(*self, lw*)

Alias for [set\\_linewidth](#).

**set\_norm**(*self, norm*)

Set the normalization instance.

**Parameters****norm**

[[Normalize](#) or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**set\_offset\_position**(*self, offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters****offset\_position**

[{'screen', 'data'}]

**Notes**

Deprecated since version 3.3.

**set\_offsets**(*self, offsets*)

Set the offsets for the collection.

**Parameters**

**offsets**

[(N, 2) or (2,) array-like]

**set\_path\_effects**(*self, path\_effects*)

Set the path effects.

**Parameters****path\_effects**

[*AbstractPathEffect*]

**set\_paths**(*self, paths*)**set\_picker**(*self, picker*)

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sizes**(*self, sizes, dpi=72.0*)

Set the sizes of each member of the collection.

**Parameters****sizes**

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.

**set\_sketch\_params**(*self, scale=None, length=None, randomness=None*)

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap**(*self, snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value

on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

### Parameters

#### **snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

#### **set\_transform(self, t)**

Set the artist transform.

### Parameters

#### **t**

[*Transform*]

#### **set\_url(self, url)**

Set the url for the artist.

### Parameters

#### **url**

[str]

#### **set\_urls(self, urls)**

### Parameters

#### **urls**

[list of str or None]

### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

#### **set\_visible(self, b)**

Set the artist's visibility.

### Parameters

**b**

[bool]

**set\_zorder**(*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba**(*self, x, alpha=None, bytes=False, norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update** (*self, props*)

Update this artist's properties from the dict *props*.

## Parameters

**props**

[dict]

```
property update_dict
```

**update\_from**(*self, other*)

Copy properties from other to self.

`update scalar mappable (self)`

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

**zorder** = 0

```
class matplotlib.collections.PolyCollection(verts, sizes=None, closed=True,  
                                         **kwargs)
```

Bases: matplotlib.collections.\_CollectionWithSizes

## Parameters

verts

[list of array-like] The sequence of polygons [ $\text{verts}_0$ ,  $\text{verts}_1$ , ...] where each element  $\text{verts}_i$  defines the vertices of polygon  $i$  as a 2D array-like of shape (M, 2).

## sizes

[array-like, default: None] Squared scaling factors for the polygons. The coordinates of each polygon `verts_i` are multiplied by the square-root of the corresponding entry in `sizes` (i.e., `sizes` specify the scaling of areas). The scaling is applied before the Artist master transform.

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSE-POLY connection at the end.

## \*\*kwargs

## **Forwarded to *Collection*.**

**add\_callback**(*self, func*)

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

## Parameters

### func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

#### int

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

See also:

`remove\_callback`

`add\_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale\_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`

The `Axes` instance the artist resides in, or `None`.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check\_update(self, checker)`  
[Deprecated]

## Notes

Deprecated since version 3.3:

### `contains`(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool`, `dict(ind=itemlist)`, where every item in itemlist contains the event.

### `convert_xunits`(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

### `convert_yunits`(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

### `draw`(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).

## Parameters

### `renderer`

[`RendererBase` subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

## Parameters

### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

### `include_self`

[`bool`] Include *self* in the list to be checked for a match.

## Returns

`list of Artist`

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`

Return whether the artist uses clipping.

`get_clip_path(self)`

Return the clip path.

`get_cmap(self)`

Return the *Colormap* instance.

`get_contains(self)`

[Deprecated] Return the custom contains function of the artist if set, or *None*.

See also:

**`set_contains`****Notes**

Deprecated since version 3.3.

**`get_cursor_data(self, event)`**

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters****`event`**

[`matplotlib.backend_bases.MouseEvent`]

**See also:****`format_cursor_data`****`get_dashes(self)`**

Alias for `get_linenstyle`.

**`get_datalim(self, transData)`****`get_ec(self)`**

Alias for `get_edgecolor`.

**`get_edgecolor(self)`****`get_edgecolors(self)`**

Alias for `get_edgecolor`.

**`get_facecolor(self)`****`get_facecolors(self)`**

Alias for `get_facecolor`.

**`get_fc(self)`**

Alias for `get_facecolor`.

**get\_figure(self)**

Return the *Figure* instance the artist belongs to.

**get\_fill(self)**

Return whether face is colored.

**get\_gid(self)**

Return the group id.

**get\_hatch(self)**

Return the current hatching pattern.

**get\_in\_layout(self)**

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_joinstyle(self)****get\_label(self)**

Return the label used for this artist in the legend.

**get\_linestyle(self)****get\_linestyles(self)**

Alias for `get_linestyle`.

**get\_linewidth(self)****get\_linewidths(self)**

Alias for `get_linewidth`.

**get\_ls(self)**

Alias for `get_linestyle`.

**get\_lw(self)**

Alias for `get_linewidth`.

**get\_offset\_position(self)**

[*Deprecated*] Return how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform(self)****get\_offsets(self)**

Return the offsets for the collection.

**get\_path\_effects(self)**

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker, pickable, pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

**Returns**

`array`

The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

**Returns**

`tuple or None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

Returns `None` if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

`renderer`

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns*****Bbox***

The enclosing bounding box (in figure pixel coordinates).

**`get_transform(self)`**

Return the `Transform` instance used by this artist.

**`get_transformed_clip_path_and_affine(self)`**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**`get_transforms(self)`****`get_url(self)`**

Return the url.

**`get_urls(self)`**

Return a list of URLs, one for each element of the collection.

The list contains `None` for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

**`get_visible(self)`**

Return the visibility.

**`get_window_extent(self, renderer)`**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**`get_zorder(self)`**

Return the artist's zorder.

**`have_units(self)`**

Return whether units are set on any axis.

**`is_transform_set(self)`**

Return whether the Artist has an explicitly set transform.

This is `True` after `set_transform` has been called.

**`property mouseover`**

If this property is set to `True`, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged(self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

**pick(self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

See also:

`set_picker`, `get_picker`, `pickable`

**pickable(self)**

Return whether the artist is pickable.

See also:

`set_picker`, `get_picker`, `pick`

**properties(self)**

Return a dictionary of all the properties of the artist.

**remove(self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**remove\_callback(self, oid)**

Remove a callback based on its observer id.

See also:

`add_callback`

**set(self, \*\*kwargs)**

A property batch setter. Pass `kwargs` to set properties.

**set\_aa(self, aa)**

Alias for `set_antialiased`.

**set\_agg\_filter**(*self, filter\_func*)  
Set the agg filter.

#### Parameters

##### **filter\_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha**(*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

#### Parameters

##### **alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**set\_animated**(*self, b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure.draw\\_artist\*](#) / [\*Axes.draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

#### Parameters

##### **b**

[bool]

**set\_antialiased**(*self, aa*)

Set the antialiasing state for rendering.

#### Parameters

##### **aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)

Alias for [\*set\\_antialiased\*](#).

**set\_array**(*self, A*)

Set the image array from numpy array *A*.

#### Parameters

**A**

[ndarray or None]

**set\_capstyle**(*self*, *cs*)

Set the *CapStyle* for the collection (for all its elements).

**Parameters****cs**

[*CapStyle* or {'butt', 'projecting', 'round'}]

**set\_clim**(*self*, *vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

**set\_clip\_box**(*self*, *clipbox*)

Set the artist's clip *Bbox*.

**Parameters****clipbox**

[*Bbox*]

**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

### transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

## Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

### set\_cmap(*self*, *cmap*)

Set the colormap for luminance data.

#### Parameters

##### cmap

[*Colormap* or str or *None*]

### set\_color(*self*, *c*)

Set both the edgecolor and the facecolor.

#### Parameters

##### c

[color or list of rgba tuples]

#### See also:

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

### set\_contains(*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

#### Parameters

##### picker

[callable] A custom picker function to evaluate if an event is within the artist.

The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

**set\_dashes** (*self*, *ls*)

Alias for `set_linenstyle`.

**set\_ec** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_edgecolor** (*self*, *c*)

Set the edgecolor(s) of the collection.

### Parameters

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_facecolor** (*self*, *c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c**

[color or list of colors]

**set\_facecolors** (*self*, *c*)

Alias for `set_facecolor`.

**set\_fc** (*self*, *c*)

Alias for `set_facecolor`.

**set\_figure**(*self, fig*)  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig**  
[*Figure*]

**set\_gid**(*self, gid*)  
Set the (group) id for the artist.

#### Parameters

**gid**  
[str]

**set\_hatch**(*self, hatch*)  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch**  
[{', '\\", '|', '-' , '+' , 'x' , 'o' , 'O' , '.' , '\*'}]

**set\_in\_layout**(*self, in\_layout*)  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout**

[bool]

**set\_joinstyle**(*self, js*)Set the *JoinStyle* for the collection (for all its elements).**Parameters****js**[*JoinStyle* or {'miter', 'round', 'bevel'}]**set\_label**(*self, s*)

Set a label that will be displayed in the legend.

**Parameters****s**[object] *s* will be converted to a string by calling *str*.**set\_linestyle**(*self, ls*)

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where *onoffseq* is an even length tuple of on and off ink in points.**Parameters****ls**[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ", (offset, on-off-seq)}. See *Line2D.set\_linestyle* for a complete description.**set\_linestyles**(*self, ls*)Alias for *set\_linestyle*.**set linewidth**(*self, lw*)Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****lw**

[float or list of floats]

**set\_linewidths**(*self, lw*)

Alias for [set\\_linewidth](#).

**set\_ls**(*self, ls*)

Alias for [set\\_linestyle](#).

**set\_lw**(*self, lw*)

Alias for [set\\_linewidth](#).

**set\_norm**(*self, norm*)

Set the normalization instance.

**Parameters****norm**

[[Normalize](#) or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**set\_offset\_position**(*self, offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters****offset\_position**

[{'screen', 'data'}]

**Notes**

Deprecated since version 3.3.

**set\_offsets**(*self, offsets*)

Set the offsets for the collection.

**Parameters**

**offsets**

[(N, 2) or (2,) array-like]

**set\_path\_effects**(*self, path\_effects*)

Set the path effects.

**Parameters****path\_effects**

[*AbstractPathEffect*]

**set\_paths**(*self, verts, closed=True*)

Set the vertices of the polygons.

**Parameters****verts**

[list of array-like] The sequence of polygons [*verts0, verts1, ...*] where each element *verts\_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

**closed**

[bool, default: True] Whether the polygon should be closed by adding a CLOSE-POLY connection at the end.

**set\_picker**(*self, picker*)

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sizes**(*self, sizes, dpi=72.0*)

Set the sizes of each member of the collection.

**Parameters****sizes**

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.

**set\_sketch\_params**(*self, scale=None, length=None, randomness=None*)

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap (self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform (self, t)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url (self, url)**

Set the url for the artist.

**Parameters****url**

[str]

**set\_urls (self, urls)****Parameters**

**urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_verts(*self, verts, closed=True*)**

Set the vertices of the polygons.

**Parameters****verts**

[list of array-like] The sequence of polygons [*verts0, verts1, ...*] where each element *verts\_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

**closed**

[bool, default: True] Whether the polygon should be closed by adding a CLOSE-POLY connection at the end.

**set\_verts\_and\_codes(*self, verts, codes*)**

Initialize vertices with path codes.

**set\_visible(*self, b*)**

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder(*self, level*)**

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `to_rgba` (*self, x, alpha=None, bytes=False, norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update` (*self, props*)

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

##### `property update_dict`

##### `update_from` (*self, other*)

Copy properties from other to self.

##### `update_scalarmappable` (*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

```
zorder = 0
class matplotlib.collections.QuadMesh(meshWidth, meshHeight, coordinates, an-
tialiased=True, shading='flat', **kwargs)
Bases: matplotlib.collections.Collection
```

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh consists of a grid of vertices. The dimensions of this array are (*meshWidth* + 1, *meshHeight* + 1). Each vertex in the mesh has a different set of "mesh coordinates" representing its position in the topology of the mesh. For any values (*m*, *n*) such that  $0 \leq m \leq \text{meshWidth}$  and  $0 \leq n \leq \text{meshHeight}$ , the vertices at mesh coordinates (*m*, *n*), (*m*, *n* + 1), (*m* + 1, *n* + 1), and (*m* + 1, *n*) form one of the quadrilaterals in the mesh. There are thus (*meshWidth* \* *meshHeight*) quadrilaterals in the mesh. The mesh need not be regular and the polygons need not be convex.

A quadrilateral mesh is represented by a (2 x ((*meshWidth* + 1) \* (*meshHeight* + 1))) numpy array *coordinates*, where each row is the *x* and *y* coordinates of one of the vertices. To define the function that maps from a data point to its corresponding color, use the *set\_cmap()* method. Each of these arrays is indexed in row-major order by the mesh coordinates of the vertex (or the mesh coordinates of the lower left vertex, in the case of the colors).

For example, the first entry in *coordinates* is the coordinates of the vertex at mesh coordinates (0, 0), then the one at (0, 1), then at (0, 2) ... (0, *meshWidth*), (1, 0), (1, 1), and so on.

*shading* may be 'flat', or 'gouraud'

## Parameters

### edgecolors

[color or list of colors, default: `rcParams["patch.edgecolor"]`] (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

### facecolors

[color or list of colors, default: `rcParams["patch.facecolor"]`] (default: 'C0')] Face color for each patch making up the collection.

### linewidths

[float or list of floats, default: `rcParams["patch.linewidth"]`] (default: 1.0)] Line width for each patch making up the collection.

### linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dash-dot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

(offset, onoffseq),

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see /gallery/lines\_bars\_and\_markers/linestyles.

### capstyle

[*CapStyle*-like, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. Allowed values are {'butt', 'projecting', 'round'}.

### joinstyle

[*JoinStyle*-like, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. Allowed values are {'miter', 'round', 'bevel'}.

### antialiaseds

[bool or list of bool, default: `rcParams["patch.antialiased"]`] (default: True) Whether each patch in the collection should be drawn with antialiasing.

### offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

### transOffset

[*Transform*, default: `IdentityTransform`] A single transform which will be applied to each `offsets` vector before it is used.

### offset\_position

[{ {'screen' (default), 'data' (deprecated)} }] If set to 'data' (deprecated), `offsets` will be treated as if it is in data coordinates instead of in screen coordinates.

### norm

[*Normalize*, optional] Forwarded to `ScalarMappable`. The default of None means that the first draw call will set `vmin` and `vmax` using the minimum and maximum values of the data.

### cmap

[*Colormap*, optional] Forwarded to `ScalarMappable`. The default of None will result in `rcParams["image.cmap"]` (default: 'viridis') being used.

### hatch

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/',' ','|','-','+','x','o','O','.','\*']. See /gallery/shapes\_and\_collections/hatch\_style\_reference for the meaning of each hatch type.

### pickradius

[float, default: 5.0] If `pickradius <= 0`, then `Collection.contains` will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

**urls**

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See /gallery/misc/hyperlinks\_sgskip for examples.

**zorder**

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder\_demo for all defaults and examples.

**add\_callback (self, func)**

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:****`remove_callback`****add\_checker (self, checker)**

[Deprecated]

**Notes**

Deprecated since version 3.3:

**`autoscale (self)`**

Autoscale the scalar limits on the norm instance using the current array

**`autoscale_None (self)`**

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**`property axes`**

The *Axes* instance the artist resides in, or *None*.

**changed**(*self*)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**check\_update**(*self, checker*)

[*Deprecated*]

## Notes

Deprecated since version 3.3:

**contains**(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

**static convert\_mesh\_to\_paths**(*meshWidth, meshHeight, coordinates*)

Convert a given mesh into a sequence of `Path` objects.

This function is primarily of use to implementers of backends that do not directly support quadmeshes.

**convert\_mesh\_to\_triangles**(*self, meshWidth, meshHeight, coordinates*)

Convert a given mesh into a sequence of triangles, each point with its own color. This is useful for experiments using `draw_gouraud_triangle`.

**convert\_xunits**(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**convert\_yunits**(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**draw**(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

## Parameters

**renderer**

[*RendererBase* subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

##### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

##### `include_self`

[bool] Include *self* in the list to be checked for a match.

#### Returns

##### `list of Artist`

### `format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

##### `get_cursor_data`

### `get_agg_filter`(*self*)

Return filter function to be used for agg filter.

### `get_alpha`(*self*)

Return the alpha value used for blending - not supported on all backends.

### `get_animated`(*self*)

Return whether the artist is animated.

---

```
get_array(self)
    Return the data array.

get_capstyle(self)
get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.
```

**See also:**

[set\\_contains](#)

## Notes

Deprecated since version 3.3.

```
get_cursor_data(self, event)
    Return the cursor data for a given event.
```

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that [format\\_cursor\\_data](#) can convert the data to a string representation.

The only current use case is displaying the z-value of an [AxesImage](#) in the status bar of a plot window, while moving the mouse.

## Parameters

**event**

[*matplotlib.backend\_bases.MouseEvent*]

See also:

[`format\_cursor\_data`](#)

**get\_dashes**(*self*)

Alias for [`get\_linestyle`](#).

**get\_datalim**(*self, transData*)

**get\_ec**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_edgecolor**(*self*)

**get\_edgecolors**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_facecolor**(*self*)

**get\_facecolors**(*self*)

Alias for [`get\_facecolor`](#).

**get\_fc**(*self*)

Alias for [`get\_facecolor`](#).

**get\_figure**(*self*)

Return the [`Figure`](#) instance the artist belongs to.

**get\_fill**(*self*)

Return whether face is colored.

**get\_gid**(*self*)

Return the group id.

**get\_hatch**(*self*)

Return the current hatching pattern.

**get\_in\_layout**(*self*)

Return boolean flag, True if artist is included in layout calculations.

E.g. [`Constrained Layout Guide`](#), [`Figure.tight\_layout\(\)`](#), and [`fig.savefig\(fname, bbox\_inches='tight'\)`](#).

**get\_joinstyle**(*self*)

**get\_label**(*self*)

Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)

Alias for [`get\_linestyle`](#).

**get linewidth**(*self*)

**get\_linewidths**(*self*)  
Alias for [get\\_linewidth](#).

**get\_ls**(*self*)  
Alias for [get\\_linestyle](#).

**get\_lw**(*self*)  
Alias for [get\\_linewidth](#).

**get\_offset\_position**(*self*)

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform**(*self*)

**get\_offsets**(*self*)  
Return the offsets for the collection.

**get\_path\_effects**(*self*)

**get\_paths**(*self*)

**get\_picker**(*self*)  
Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).

See also:

[set\\_picker](#), [pickable](#), [pick](#)

**get\_pickradius**(*self*)

**get\_rasterized**(*self*)  
Return whether the artist is to be rasterized.

**get\_sketch\_params**(*self*)  
Return the sketch parameters for the artist.

## Returns

**tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.

- *randomness*: The scale factor by which the length is shrunken or expanded.  
Returns *None* if no sketch parameters were set.

**get\_snap(self)**

Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox(self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

**Parameters****renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns****Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform(self)**

Return the [Transform](#) instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine(self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms(self)****get\_url(self)**

Return the url.

**get\_urls(self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

**get\_visible(self)**

Return the visibility.

**get\_window\_extent(self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing

the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder (self)**

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

**`add_callback`****`remove_callback`****pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

See also:

**`set_picker, get_picker, pickable`****pickable (self)**

Return whether the artist is pickable.

See also:

**`set_picker, get_picker, pick`****properties (self)**

Return a dictionary of all the properties of the artist.

**remove (self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

### `remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

### `add_callback`

### `set(self, **kwargs)`

A property batch setter. Pass `kwargs` to set properties.

### `set_aa(self, aa)`

Alias for `set_antialiased`.

### `set_agg_filter(self, filter_func)`

Set the agg filter.

#### Parameters

##### `filter_func`

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

### `set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

##### `alpha`

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

### `set_animated(self, b)`

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call `Figure.draw_artist`/`Axes.draw_artist` explicitly on the artist. This approach is used to speed up animations using blitting.

See also `matplotlib.animation` and `Faster rendering by using blitting`.

#### Parameters

##### `b`

[bool]

**set\_antialiased**(*self, aa*)  
Set the antialiasing state for rendering.

#### Parameters

**aa**  
[bool or list of bools]

**set\_antialiaseds**(*self, aa*)  
Alias for `set_antialiased`.

**set\_array**(*self, A*)  
Set the image array from numpy array *A*.

#### Parameters

**A**  
[ndarray or None]

**set\_capstyle**(*self, cs*)  
Set the `CapStyle` for the collection (for all its elements).

#### Parameters

**cs**  
[`CapStyle` or {'butt', 'projecting', 'round'}]

**set\_clim**(*self, vmin=None, vmax=None*)  
Set the norm limits for image scaling.

#### Parameters

**vmin, vmax**  
[float] The limits.

The limits may also be passed as a tuple (*vmin, vmax*) as a single positional argument.

**set\_clip\_box**(*self, clipbox*)  
Set the artist's clip `Bbox`.

#### Parameters

**clipbox**  
[`Bbox`]

**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When *False* artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap**(*self*, *cmap*)

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or *None*]

**set\_color**(*self*, *c*)

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set\_contains** (*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴
    dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes** (*self*, *ls*)

Alias for `set_linenstyle`.

**set\_ec** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_edgecolor** (*self*, *c*)

Set the edgecolor(s) of the collection.

**Parameters****c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors** (*self*, *c*)

Alias for `set_edgecolor`.

**set\_facecolor**(*self, c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters****c**

[color or list of colors]

**set\_facecolors**(*self, c*)

Alias for [set\\_facecolor](#).

**set\_fc**(*self, c*)

Alias for [set\\_facecolor](#).

**set\_figure**(*self, fig*)

Set the [Figure](#) instance the artist belongs to.

**Parameters****fig**

[[Figure](#)]

**set\_gid**(*self, gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch**(*self, hatch*)

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

#### **hatch**

[{'/', '\\", '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

#### **set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout \(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

#### **in\_layout**

[bool]

#### **set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

#### **js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

#### **set\_label (self, s)**

Set a label that will be displayed in the legend.

### Parameters

#### **s**

[object] *s* will be converted to a string by calling `str`.

#### **set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),
---------------------

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

#### ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ","}, (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

#### `set_linestyles`(*self*, *ls*)

Alias for `set_linestyle`.

#### `set_linewidth`(*self*, *lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

#### lw

[float or list of floats]

#### `set_linewidths`(*self*, *lw*)

Alias for `set_linewidth`.

#### `set_ls`(*self*, *ls*)

Alias for `set_linestyle`.

#### `set_lw`(*self*, *lw*)

Alias for `set_linewidth`.

#### `set_norm`(*self*, *norm*)

Set the normalization instance.

### Parameters

#### norm

[`Normalize` or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

#### `set_offset_position`(*self*, *offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position**

```
[{'screen', 'data'}]
```

**Notes**

Deprecated since version 3.3.

**set\_offsets (self, offsets)**

Set the offsets for the collection.

**Parameters****offsets**

```
[(N, 2) or (2,) array-like]
```

**set\_path\_effects (self, path\_effects)**

Set the path effects.

**Parameters****path\_effects**

```
[AbstractPathEffect]
```

**set\_paths (self)****set\_picker (self, picker)**

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius (self, pr)**

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized (self, rasterized)**

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sketch\_params (self, scale=None, length=None, randomness=None)**

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap (self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value

on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

### Parameters

#### **snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

#### **set\_transform(self, t)**

Set the artist transform.

### Parameters

#### **t**

[*Transform*]

#### **set\_url(self, url)**

Set the url for the artist.

### Parameters

#### **url**

[str]

#### **set\_urls(self, urls)**

### Parameters

#### **urls**

[list of str or None]

## Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

#### **set\_visible(self, b)**

Set the artist's visibility.

### Parameters

**b**

[bool]

**set\_zorder**(*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba**(*self, x, alpha=None, bytes=False, norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update**(*self, props*)

Update this artist's properties from the dict *props*.

**Parameters****props**

[dict]

**property update\_dict****update\_from**(*self, other*)

Copy properties from other to self.

**update\_scalarmappable**(*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

**zorder = 0**

```
class matplotlib.collections.RegularPolyCollection(numsides, rotation=0,  
                                                 sizes=I, **kwargs)
```

Bases: matplotlib.collections.\_CollectionWithSizes

A collection of n-sided regular polygons.

**Parameters****numsides**

[int] The number of sides of the polygon.

**rotation**

[float] The rotation of the polygon in radians.

**sizes**

[tuple of float] The area of the circle circumscribing the polygon in points^2.

**\*\*kwargs**

Forwarded to *Collection*.

**Examples**

See /gallery/event\_handling/lasso\_demo for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
```

(continues on next page)

(continued from previous page)

```
rotation=0, sizes=(50,),  
facecolors=facecolors,  
edgecolors=("black",),  
linewidths=(1,),  
offsets=offsets,  
transOffset=ax.transData,  
)
```

**add\_callback**(self, func)Add a callback function that will be called whenever one of the *Artist*'s properties changes.**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.**Returns****int**The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.**See also:****[remove\\_callback](#)****add\_checker**(self, checker)

[Deprecated]

**Notes**

Deprecated since version 3.3:

**autoscale**(self)

Autoscale the scalar limits on the norm instance using the current array

**autoscale\_None**(self)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**property axes**The *Axes* instance the artist resides in, or *None*.

**changed**(*self*)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**check\_update**(*self, checker*)

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**contains**(*self, mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

**convert\_xunits**(*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**convert\_yunits**(*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**draw**(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters****renderer**

[`RendererBase` subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**findobj**(*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

**Parameters****match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`.  
The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

### `include_self`

[bool] Include *self* in the list to be checked for a match.

### Returns

list of `Artist`

### `format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

`get_cursor_data`

### `get_agg_filter(self)`

Return filter function to be used for agg filter.

### `get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

### `get_animated(self)`

Return whether the artist is animated.

### `get_array(self)`

Return the data array.

### `get_capstyle(self)`

### `get_children(self)`

Return a list of the child `Artists` of this `Artist`.

### `get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

### `get_clip_box(self)`

Return the clipbox.

### `get_clip_on(self)`

Return whether the artist uses clipping.

**get\_clip\_path(self)**

Return the clip path.

**get\_cmap(self)**

Return the [Colormap](#) instance.

**get\_contains(self)**

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

[\*set\\_contains\*](#)

## Notes

Deprecated since version 3.3.

**get\_cursor\_data(self, event)**

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that [\*format\\_cursor\\_data\*](#) can convert the data to a string representation.

The only current use case is displaying the z-value of an [AxesImage](#) in the status bar of a plot window, while moving the mouse.

## Parameters

**event**

[[matplotlib.backend\\_bases.MouseEvent](#)]

**See also:**

[\*format\\_cursor\\_data\*](#)

**get\_dashes(self)**

Alias for [\*get\\_linestyle\*](#).

**get\_datalim(self, transData)****get\_ec(self)**

Alias for [\*get\\_edgecolor\*](#).

**get\_edgecolor(self)**

**get\_edgecolors**(*self*)  
Alias for [get\\_edgecolor](#).

**get\_facecolor**(*self*)

**get\_facecolors**(*self*)  
Alias for [get\\_facecolor](#).

**get\_fc**(*self*)  
Alias for [get\\_facecolor](#).

**get\_figure**(*self*)  
Return the *Figure* instance the artist belongs to.

**get\_fill**(*self*)  
Return whether face is colored.

**get\_gid**(*self*)  
Return the group id.

**get\_hatch**(*self*)  
Return the current hatching pattern.

**get\_in\_layout**(*self*)  
Return boolean flag, True if artist is included in layout calculations.  
E.g. [Constrained Layout Guide](#), `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_joinstyle**(*self*)

**get\_label**(*self*)  
Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)  
Alias for [get\\_linestyle](#).

**get\_linewidth**(*self*)

**get\_linewidths**(*self*)  
Alias for [get\\_linewidth](#).

**get\_ls**(*self*)  
Alias for [get\\_linestyle](#).

**get\_lw**(*self*)  
Alias for [get\\_linewidth](#).

**get\_numsides**(*self*)

**get\_offset\_position**(*self*)  
[Deprecated] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker, pickable, pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_rotation(self)`

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

**Returns**

`array`

The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

**Returns**

`tuple or None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

Returns `None` if no sketch parameters were set.

**get\_snap (self)**

Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox (self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

**Parameters****renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns****Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform (self)**

Return the [Transform](#) instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine (self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms (self)****get\_url (self)**

Return the url.

**get\_urls (self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

**get\_visible (self)**

Return the visibility.

**get\_window\_extent (self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder (self)**

Return the artist's zorder.

**have\_units (self)**

Return whether units are set on any axis.

**is\_transform\_set (self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged (self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

**pick (self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

`set_picker`, `get_picker`, `pickable`

**pickable (self)**

Return whether the artist is pickable.

See also:

`set_picker`, `get_picker`, `pick`

**properties (self)**

Return a dictionary of all the properties of the artist.

**remove (self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**`remove_callback(self, oid)`**

Remove a callback based on its observer id.

**See also:**

**`add_callback`****`set(self, **kwargs)`**

A property batch setter. Pass *kwargs* to set properties.

**`set_aa(self, aa)`**

Alias for `set_antialiased`.

**`set_agg_filter(self, filter_func)`**

Set the agg filter.

**Parameters****`filter_func`**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**`set_alpha(self, alpha)`**

Set the alpha value used for blending - not supported on all backends.

**Parameters****`alpha`**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**`set_animated(self, b)`**

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call `Figure.draw_artist`/`Axes.draw_artist` explicitly on the artist. This approach is used to speed up animations using blitting.

See also `matplotlib.animation` and *Faster rendering by using blitting*.

**Parameters****`b`**

[bool]

**`set_antialiased(self, aa)`**

Set the antialiasing state for rendering.

**Parameters**

**aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)

Alias for [set\\_antialiased](#).

**set\_array**(*self, A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self, cs*)

Set the [CapStyle](#) for the collection (for all its elements).

**Parameters****cs**

[[CapStyle](#) or {'butt', 'projecting', 'round'}]

**set\_clim**(*self, vmin=None, vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin, vmax*) as a single positional argument.

**set\_clip\_box**(*self, clipbox*)

Set the artist's clip [Bbox](#).

**Parameters****clipbox**

[[Bbox](#)]

**set\_clip\_on**(*self, b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b**

[bool]

**set\_clip\_path**(*self, path, transform=None*)

Set the artist's clip path.

#### Parameters

**path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

#### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path, transform*) is also accepted as a single positional parameter.

**set\_cmap**(*self, cmap*)

Set the colormap for luminance data.

#### Parameters

**cmap**

[*Colormap* or str or *None*]

**set\_color**(*self, c*)

Set both the edgecolor and the facecolor.

#### Parameters

**c**

[color or list of rgba tuples]

#### See also:

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set\_contains**(*self, picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴
    dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes**(*self, ls*)

Alias for `set_linenstyle`.

**set\_ec**(*self, c*)

Alias for `set_edgecolor`.

**set\_edgecolor**(*self, c*)

Set the edgecolor(s) of the collection.

**Parameters****c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(*self, c*)

Alias for `set_edgecolor`.

**set\_facecolor**(*self, c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters**

**c**

[color or list of colors]

**set\_facecolors**(*self, c*)Alias for [set\\_facecolor](#).**set\_fc**(*self, c*)Alias for [set\\_facecolor](#).**set\_figure**(*self, fig*)Set the [Figure](#) instance the artist belongs to.**Parameters****fig**[[Figure](#)]**set\_gid**(*self, gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch**(*self, hatch*)

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch**

[{'/', '\', '|', '—', '+', 'x', 'o', 'O', '.', '\*'}]

**set\_in\_layout (self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters****in\_layout**

[bool]

**set\_joinstyle (self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

**Parameters****js**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_label (self, s)**

Set a label that will be displayed in the legend.

**Parameters****s**

[object] s will be converted to a string by calling `str`.

**set\_linestyle (self, ls)**

Set the linestyle(s) for the collection.

linestyle	description
'—' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),
---------------------

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters****ls**

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', "", (offset, on-off-seq)}. See [`Line2D.set\_linestyle`](#) for a complete description.

**`set_linestyles`(*self*, *ls*)**

Alias for [`set\_linestyle`](#).

**`set_linewidth`(*self*, *lw*)**

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****`lw`**

[float or list of floats]

**`set_linewidths`(*self*, *lw*)**

Alias for [`set\_linewidth`](#).

**`set_ls`(*self*, *ls*)**

Alias for [`set\_linestyle`](#).

**`set_lw`(*self*, *lw*)**

Alias for [`set\_linewidth`](#).

**`set_norm`(*self*, *norm*)**

Set the normalization instance.

**Parameters****`norm`**

[[`Normalize`](#) or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**`set_offset_position`(*self*, *offset\_position*)**

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters****`offset_position`**

[{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

### `set_offsets(self, offsets)`

Set the offsets for the collection.

#### Parameters

##### `offsets`

[(N, 2) or (2,) array-like]

### `set_path_effects(self, path_effects)`

Set the path effects.

#### Parameters

##### `path_effects`

[*AbstractPathEffect*]

### `set_paths(self)`

### `set_picker(self, picker)`

Define the picking behavior of the artist.

#### Parameters

##### `picker`

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sizes**(*self, sizes, dpi=72.0*)

Set the sizes of each member of the collection.

**Parameters****sizes**

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.

**set\_sketch\_params**(*self, scale=None, length=None, randomness=None*)

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap (self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform (self, t)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url (self, url)**

Set the url for the artist.

**Parameters****url**

[str]

**set\_urls (self, urls)****Parameters****urls**

[list of str or None]

## Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

### `set_visible(self, b)`

Set the artist's visibility.

#### Parameters

##### **b**

[bool]

### `set_zorder(self, level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

##### **level**

[float]

### `property stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

### `property sticky_edges`

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError

will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the `rgba` array will be floats in the 0-1 range; if it is *True*, the returned `rgba` array will be `uint8` in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update(self, props)`

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

### `property update_dict`

### `update_from(self, other)`

Copy properties from other to self.

### `update_scalarmappable(self)`

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

### `zorder = 0`

**class** `matplotlib.collections.StarPolygonCollection(numsides, rotation=0, sizes=1, **kwargs)`

Bases: `matplotlib.collections.RegularPolyCollection`

Draw a collection of regular stars with *numsides* points.

#### Parameters

##### `numsides`

[int] The number of sides of the polygon.

##### `rotation`

[float] The rotation of the polygon in radians.

##### `sizes`

[tuple of float] The area of the circle circumscribing the polygon in points<sup>^2</sup>.

##### `**kwargs`

Forwarded to `Collection`.

## Examples

See /gallery/event\_handling/lasso\_demo for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]  
  
collection = RegularPolyCollection(  
    numSides=5, # a pentagon  
    rotation=0, sizes=(50,),  
    facecolors=facecolors,  
    edgecolors=("black",),  
    linewidths=(1,),  
    offsets=offsets,  
    transOffset=ax.transData,  
)
```

### `add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

#### Parameters

##### `func`

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

#### Returns

##### `int`

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

#### See also:

[`remove\_callback`](#)

### `add_checker(self, checker)`

[Deprecated]

## Notes

Deprecated since version 3.3:

### `autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

### `autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

### `property axes`

The `Axes` instance the artist resides in, or `None`.

### `changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

### `check_update(self, checker)`

[*Deprecated*]

## Notes

Deprecated since version 3.3:

### `contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns `bool`, `dict(ind=itemlist)`, where every item in itemlist contains the event.

### `convert_xunits(self, x)`

Convert `x` using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, `x` itself is returned.

### `convert_yunits(self, y)`

Convert `y` using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, `y` itself is returned.

### `draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

## Parameters

### `renderer`

[*RendererBase* subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

##### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

##### `include_self`

[bool] Include *self* in the list to be checked for a match.

#### Returns

##### `list of Artist`

### `format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

##### `get_cursor_data`

### `get_agg_filter`(*self*)

Return filter function to be used for agg filter.

### `get_alpha`(*self*)

Return the alpha value used for blending - not supported on all backends.

### `get_animated`(*self*)

Return whether the artist is animated.

---

```
get_array(self)
    Return the data array.

get_capstyle(self)
get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.
```

**See also:**

[set\\_contains](#)

## Notes

Deprecated since version 3.3.

```
get_cursor_data(self, event)
    Return the cursor data for a given event.
```

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that [format\\_cursor\\_data](#) can convert the data to a string representation.

The only current use case is displaying the z-value of an [AxesImage](#) in the status bar of a plot window, while moving the mouse.

## Parameters

**event**

[*matplotlib.backend\_bases.MouseEvent*]

See also:

[`format\_cursor\_data`](#)

**get\_dashes**(*self*)

Alias for [`get\_linestyle`](#).

**get\_datalim**(*self, transData*)

**get\_ec**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_edgecolor**(*self*)

**get\_edgecolors**(*self*)

Alias for [`get\_edgecolor`](#).

**get\_facecolor**(*self*)

**get\_facecolors**(*self*)

Alias for [`get\_facecolor`](#).

**get\_fc**(*self*)

Alias for [`get\_facecolor`](#).

**get\_figure**(*self*)

Return the [`Figure`](#) instance the artist belongs to.

**get\_fill**(*self*)

Return whether face is colored.

**get\_gid**(*self*)

Return the group id.

**get\_hatch**(*self*)

Return the current hatching pattern.

**get\_in\_layout**(*self*)

Return boolean flag, True if artist is included in layout calculations.

E.g. [`Constrained Layout Guide`](#), [`Figure.tight\_layout\(\)`](#), and [`fig.savefig\(fname, bbox\_inches='tight'\)`](#).

**get\_joinstyle**(*self*)

**get\_label**(*self*)

Return the label used for this artist in the legend.

**get\_linestyle**(*self*)

**get\_linestyles**(*self*)

Alias for [`get\_linestyle`](#).

**get linewidth**(*self*)

---

```
get_linewidths(self)
    Alias for get\_linewidth.
```

```
get_ls(self)
    Alias for get\_linestyle.
```

```
get_lw(self)
    Alias for get\_linewidth.
```

```
get_numsides(self)
```

```
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
```

## Notes

Deprecated since version 3.3.

```
get_offset_transform(self)
```

```
get_offsets(self)
```

Return the offsets for the collection.

```
get_path_effects(self)
```

```
get_paths(self)
```

```
get_picker(self)
```

Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).

**See also:**

[set\\_picker](#), [pickable](#), [pick](#)

```
get_pickradius(self)
```

```
get_rasterized(self)
```

Return whether the artist is to be rasterized.

```
get_rotation(self)
```

```
get_sizes(self)
```

Return the sizes ('areas') of the elements in the collection.

## Returns

**array**

The 'area' of each element.

**get\_sketch\_params (self)**

Return the sketch parameters for the artist.

**Returns****tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap (self)**

Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox (self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

**Parameters****renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns****Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform (self)**

Return the [Transform](#) instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine (self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms (self)****get\_url (self)**

Return the url.

**get\_urls (self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

**get\_visible**(*self*)

Return the visibility.

**get\_window\_extent**(*self, renderer*)

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder**(*self*)

Return the artist's zorder.

**have\_units**(*self*)

Return whether units are set on any axis.

**is\_transform\_set**(*self*)

Return whether the Artist has an explicitly set transform.

This is *True* after [\*set\\_transform\*](#) has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also [\*get\\_cursor\\_data\(\)\*](#), [\*ToolCursorPosition\*](#) and [\*NavigationToolbar2\*](#).

**pchanged**(*self*)

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

[\*add\\_callback\*](#)

[\*remove\\_callback\*](#)

**pick**(*self, mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

[\*set\\_picker\*](#), [\*get\\_picker\*](#), [\*pickable\*](#)

### `pickable(self)`

Return whether the artist is pickable.

**See also:**

`set\_picker, get\_picker, pick`

### `properties(self)`

Return a dictionary of all the properties of the artist.

### `remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

### `remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add\_callback`

### `set(self, **kwargs)`

A property batch setter. Pass `kwargs` to set properties.

### `set_aa(self, aa)`

Alias for `set\_antialiased`.

### `set_agg_filter(self, filter_func)`

Set the agg filter.

#### Parameters

##### `filter_func`

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

### `set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

##### `alpha`

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

**set\_animated**(*self*, *b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure\*.\*draw\\_artist\*](#)/[\*Axes\*.\*draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

**Parameters****b**

[bool]

**set\_antialiased**(*self*, *aa*)

Set the antialiasing state for rendering.

**Parameters****aa**

[bool or list of bools]

**set\_antialiaseds**(*self*, *aa*)

Alias for [\*set\\_antialiased\*](#).

**set\_array**(*self*, *A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self*, *cs*)

Set the [\*CapStyle\*](#) for the collection (for all its elements).

**Parameters****cs**

[[\*CapStyle\*](#) or {'butt', 'projecting', 'round'}]

**set\_clim**(*self*, *vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

**Parameters****vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple ( $vmin$ ,  $vmax$ ) as a single positional argument.

**set\_clip\_box** (*self*, *clipbox*)  
Set the artist's clip *Bbox*.

#### Parameters

**clipbox**

[*Bbox*]

**set\_clip\_on** (*self*, *b*)  
Set whether the artist uses clipping.

When *False* artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b**

[bool]

**set\_clip\_path** (*self*, *path*, *transform=None*)  
Set the artist's clip path.

#### Parameters

**path**

[*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap** (*self*, *cmap*)  
Set the colormap for luminance data.

#### Parameters

**cmap**

[*Colormap* or str or None]

**set\_color(*self*, *c*)**

Set both the edgecolor and the facecolor.

**Parameters****c**

[color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set\_contains(*self*, *picker*)**

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool,_
    dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dashes(*self*, *ls*)**

Alias for `set_linenstyle`.

**set\_ec(*self*, *c*)**

Alias for `set_edgecolor`.

**set\_edgecolor(self, c)**

Set the edgecolor(s) of the collection.

**Parameters****c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors(self, c)**

Alias for [set\\_edgecolor](#).

**set\_facecolor(self, c)**

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters****c**

[color or list of colors]

**set\_facecolors(self, c)**

Alias for [set\\_facecolor](#).

**set\_fc(self, c)**

Alias for [set\\_facecolor](#).

**set\_figure(self, fig)**

Set the [Figure](#) instance the artist belongs to.

**Parameters****fig**

[[Figure](#)]

**set\_gid(self, gid)**

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_hatch(self, hatch)**

Set the hatching pattern

*hatch* can be one of:

```

/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch**  
`[{'/', '\\", '|', '-', '+', 'x', 'o', 'O', '.', '*'}]`

### `set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide, Figure.](#) `tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout**  
`[bool]`

### `set_joinstyle(self, js)`

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

**js**  
`[JoinStyle or {'miter', 'round', 'bevel'}]`

### `set_label(self, s)`

Set a label that will be displayed in the legend.

### Parameters

**s**  
`[object] s will be converted to a string by calling str.`

**set\_linenstyle**(*self, ls*)

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters****ls**

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ", (offset, on-off-seq)}. See [`Line2D.set\_linenstyle`](#) for a complete description.

**set\_linenstyles**(*self, ls*)

Alias for [`set\_linenstyle`](#).

**set\_linewidth**(*self, lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****lw**

[float or list of floats]

**set\_linewidths**(*self, lw*)

Alias for [`set\_linewidth`](#).

**set\_ls**(*self, ls*)

Alias for [`set\_linenstyle`](#).

**set\_lw**(*self, lw*)

Alias for [`set\_linewidth`](#).

**set\_norm**(*self, norm*)

Set the normalization instance.

**Parameters****norm**

[*Normalize* or None]

## Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

### `set_offset_position`(*self*, *offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

##### `offset_position`

[{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

### `set_offsets`(*self*, *offsets*)

Set the offsets for the collection.

#### Parameters

##### `offsets`

[(N, 2) or (2,) array-like]

### `set_path_effects`(*self*, *path\_effects*)

Set the path effects.

#### Parameters

##### `path_effects`

[*AbstractPathEffect*]

### `set_paths`(*self*)

### `set_picker`(*self*, *picker*)

Define the picking behavior of the artist.

#### Parameters

##### `picker`

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sizes**(*self, sizes, dpi=72.0*)

Set the sizes of each member of the collection.

**Parameters****sizes**

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.

**set\_sketch\_params (self, scale=None, length=None, randomness=None)**

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap (self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform (self, t)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url** (*self, url*)  
Set the url for the artist.

**Parameters**

**url**  
[str]

**set\_urls** (*self, urls*)

**Parameters**

**urls**  
[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_visible** (*self, b*)  
Set the artist's visibility.

**Parameters**

**b**  
[bool]

**set\_zorder** (*self, level*)  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level**  
[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `to_rgba` (*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update` (*self*, *props*)

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

### `property update_dict`

### `update_from` (*self*, *other*)

Copy properties from *other* to *self*.

### `update_scalarmappable` (*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

### `zorder = 0`

## `class matplotlib.collections.TriMesh` (*triangulation*, *\*\*kwargs*)

Bases: [matplotlib.collections.Collection](#)

Class for the efficient drawing of a triangular mesh using Gouraud shading.

A triangular mesh is a [Triangulation](#) object.

## Parameters

### edgecolors

[color or list of colors, default: `rcParams["patch.edgecolor"]`] (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

### facecolors

[color or list of colors, default: `rcParams["patch.facecolor"]`] (default: 'C0')] Face color for each patch making up the collection.

### linewidths

[float or list of floats, default: `rcParams["patch.linewidth"]`] (default: 1.0)] Line width for each patch making up the collection.

### linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dash-dot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

(offset, onoffseq),

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see [/gallery/lines\\_bars\\_and\\_markers/linestyles](#).

### capstyle

[*CapStyle*-like, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. Allowed values are {'butt', 'projecting', 'round'}.

### joinstyle

[*JoinStyle*-like, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. Allowed values are {'miter', 'round', 'bevel'}.

### antialiaseds

[bool or list of bool, default: `rcParams["patch.antialiased"]`] (default: True)] Whether each patch in the collection should be drawn with antialiasing.

### offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

### transOffset

[*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

**offset\_position**

[{ {'screen' (default), 'data' (deprecated)} }] If set to 'data' (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

**norm**

[*Normalize*, optional] Forwarded to *ScalarMappable*. The default of None means that the first draw call will set *vmin* and *vmax* using the minimum and maximum values of the data.

**cmap**

[*Colormap*, optional] Forwarded to *ScalarMappable*. The default of None will result in `rcParams["image.cmap"]` (default: '`'viridis'`') being used.

**hatch**

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/',' ','|','-','+', 'x', 'o', 'O', '.', '\*']. See `/gallery/shapes_and_collections/hatch_style_reference` for the meaning of each hatch type.

**pickradius**

[float, default: 5.0] If *pickradius*  $\leq 0$ , then `Collection.contains` will return True whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width  $2 * \text{pickradius}$  following any of the Paths in the Collection.

**urls**

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See `/gallery/misc/hyperlinks_sgskip` for examples.

**zorder**

[float, default: 1] The drawing order, shared by all Patches in the Collection. See `/gallery/misc/zorder_demo` for all defaults and examples.

**add\_callback** (*self, func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:****`remove_callback`****`add_checker(self, checker)`**

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**`autoscale(self)`**

Autoscale the scalar limits on the norm instance using the current array

**`autoscale_None(self)`**

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**`property axes`**

The `Axes` instance the artist resides in, or *None*.

**`changed(self)`**

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

**`check_update(self, checker)`**

[*Deprecated*]

**Notes**

Deprecated since version 3.3:

**`contains(self, mouseevent)`**

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

**`static convert_mesh_to_paths(tri)`**

Convert a given mesh into a sequence of `Path` objects.

This function is primarily of use to implementers of backends that do not directly support meshes.

**`convert_xunits(self, x)`**

Convert `x` using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**convert\_yunits**(*self*, *y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**draw**(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

**Parameters****renderer**

[*RendererBase* subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**findobj**(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

**Parameters****match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`.  
The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**

[bool] Include *self* in the list to be checked for a match.

**Returns****list of *Artist*****format\_cursor\_data**(*self*, *data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

[`get\_cursor\_data`](#)

**`get_agg_filter(self)`**

Return filter function to be used for agg filter.

**`get_alpha(self)`**

Return the alpha value used for blending - not supported on all backends.

**`get_animated(self)`**

Return whether the artist is animated.

**`get_array(self)`**

Return the data array.

**`get_capstyle(self)`**

**`get_children(self)`**

Return a list of the child [Artists](#) of this [Artist](#).

**`get_clim(self)`**

Return the values (min, max) that are mapped to the colormap limits.

**`get_clip_box(self)`**

Return the clipbox.

**`get_clip_on(self)`**

Return whether the artist uses clipping.

**`get_clip_path(self)`**

Return the clip path.

**`get_cmap(self)`**

Return the [Colormap](#) instance.

**`get_contains(self)`**

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

[`set\_contains`](#)

## Notes

Deprecated since version 3.3.

**get\_cursor\_data**(*self*, *event*)

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

### Parameters

**event**

[*matplotlib.backend\_bases.MouseEvent*]

**See also:**

*format\_cursor\_data*

**get\_dashes**(*self*)

Alias for *get\_linestyle*.

**get\_datalim**(*self*, *transData*)

**get\_ec**(*self*)

Alias for *get\_edgecolor*.

**get\_edgecolor**(*self*)

**get\_edgecolors**(*self*)

Alias for *get\_edgecolor*.

**get\_facecolor**(*self*)

**get\_facecolors**(*self*)

Alias for *get\_facecolor*.

**get\_fc**(*self*)

Alias for *get\_facecolor*.

**get\_figure**(*self*)

Return the *Figure* instance the artist belongs to.

**get\_fill(self)**  
Return whether face is colored.

**get\_gid(self)**  
Return the group id.

**get\_hatch(self)**  
Return the current hatching pattern.

**get\_in\_layout(self)**  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_joinstyle(self)**

**get\_label(self)**  
Return the label used for this artist in the legend.

**get\_linestyle(self)**

**get\_linestyles(self)**  
Alias for `get_linestyle`.

**get\_linewidth(self)**

**get\_linewidths(self)**  
Alias for `get_linewidth`.

**get\_ls(self)**  
Alias for `get_linestyle`.

**get\_lw(self)**  
Alias for `get_linewidth`.

**get\_offset\_position(self)**  
[Deprecated] Return how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

**get\_offset\_transform(self)**

**get\_offsets(self)**  
Return the offsets for the collection.

**get\_path\_effects(self)**

**get\_paths(self)**

**get\_picker(self)**

Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).

**See also:**

[set\\_picker](#), [pickable](#), [pick](#)

**get\_pickradius(self)****get\_rasterized(self)**

Return whether the artist is to be rasterized.

**get\_sketch\_params(self)**

Return the sketch parameters for the artist.

**Returns****tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap(self)**

Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox(self, renderer)**

Like [Artist.get\\_window\\_extent](#), but includes any clipping.

**Parameters****renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns****Bbox**

The enclosing bounding box (in figure pixel coordinates).

**get\_transform(self)**

Return the [Transform](#) instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine(self)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_transforms(self)****get\_url(self)**

Return the url.

**get\_urls(self)**

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks\_sgskip for an example.

**get\_visible(self)**

Return the visibility.

**get\_window\_extent(self, renderer)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_zorder(self)**

Return the artist's zorder.

**have\_units(self)**

Return whether units are set on any axis.

**is\_transform\_set(self)**

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged(self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

**`add_callback`**

**`remove_callback`****`pick(self, mouseevent)`**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

**`set_picker, get_picker, pickable`****`pickable(self)`**

Return whether the artist is pickable.

**See also:**

**`set_picker, get_picker, pick`****`properties(self)`**

Return a dictionary of all the properties of the artist.

**`remove(self)`**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

**`remove_callback(self, oid)`**

Remove a callback based on its observer id.

**See also:**

**`add_callback`****`set(self, **kwargs)`**

A property batch setter. Pass *kwargs* to set properties.

**`set_aa(self, aa)`**

Alias for *set\_antialiased*.

**`set_agg_filter(self, filter_func)`**

Set the agg filter.

### Parameters

**`filter_func`**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha**(*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

**Parameters****alpha**

[array-like or scalar or None] All values must be within the 0-1 range, inclusive.  
Masked values and nans are not supported.

**set\_animated**(*self, b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw\_artist*/*Axes.draw\_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

**Parameters****b**

[bool]

**set\_antialiased**(*self, aa*)

Set the antialiasing state for rendering.

**Parameters****aa**

[bool or list of bools]

**set\_antialiaseds**(*self, aa*)

Alias for *set\_antialiased*.

**set\_array**(*self, A*)

Set the image array from numpy array *A*.

**Parameters****A**

[ndarray or None]

**set\_capstyle**(*self, cs*)

Set the *CapStyle* for the collection (for all its elements).

**Parameters****cs**

[*CapStyle* or {'butt', 'projecting', 'round'}]

**set\_clim**(*self*, *vmin=None*, *vmax=None*)  
Set the norm limits for image scaling.

#### Parameters

##### **vmin, vmax**

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

**set\_clip\_box**(*self*, *clipbox*)  
Set the artist's clip *Bbox*.

#### Parameters

##### **clipbox**

[*Bbox*]

**set\_clip\_on**(*self*, *b*)  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

##### **b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)  
Set the artist's clip path.

#### Parameters

##### **path**

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

##### **transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

## Notes

For efficiency, if *path* is a `Rectangle` this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

### `set_cmap(self, cmap)`

Set the colormap for luminance data.

#### Parameters

##### `cmap`

[`Colormap` or str or None]

### `set_color(self, c)`

Set both the edgecolor and the facecolor.

#### Parameters

##### `c`

[color or list of rgba tuples]

#### See also:

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

### `set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

#### Parameters

##### `picker`

[callable] A custom picker function to evaluate if an event is within the artist.  
The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool,  
            dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

**set\_dashes**(*self*, *ls*)

Alias for [set\\_linenstyle](#).

**set\_ec**(*self*, *c*)

Alias for [set\\_edgecolor](#).

**set\_edgecolor**(*self*, *c*)

Set the edgecolor(s) of the collection.

### Parameters

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

**set\_edgecolors**(*self*, *c*)

Alias for [set\\_edgecolor](#).

**set\_facecolor**(*self*, *c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c**

[color or list of colors]

**set\_facecolors**(*self*, *c*)

Alias for [set\\_facecolor](#).

**set\_fc**(*self*, *c*)

Alias for [set\\_facecolor](#).

**set\_figure**(*self*, *fig*)

Set the [Figure](#) instance the artist belongs to.

### Parameters

**fig**

[*Figure*]

**set\_gid**(*self*, *gid*)

Set the (group) id for the artist.

### Parameters

**gid**

[str]

**set\_hatch(self, hatch)**

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch**

[{ '/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*' }]

**set\_in\_layout(self, in\_layout)**

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout**

[bool]

**set\_joinstyle(self, js)**

Set the [JoinStyle](#) for the collection (for all its elements).

### Parameters

**js**[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_label**(*self, s*)

Set a label that will be displayed in the legend.

**Parameters****s**

[object] *s* will be converted to a string by calling `str`.

**set\_linestyle**(*self, ls*)

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters****ls**

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '.', (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

**set\_linestyles**(*self, ls*)

Alias for `set_linestyle`.

**set\_linewidth**(*self, lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters****lw**

[float or list of floats]

**set\_linewidths**(*self, lw*)

Alias for `set_linewidth`.

**set\_ls**(*self, ls*)

Alias for `set_linestyle`.

**set\_lw** (*self, lw*)  
Alias for [set\\_linewidth](#).

**set\_norm** (*self, norm*)  
Set the normalization instance.

#### Parameters

##### norm

[[Normalize](#) or None]

#### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**set\_offset\_position** (*self, offset\_position*)

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

##### offset\_position

[{'screen', 'data'}]

#### Notes

Deprecated since version 3.3.

**set\_offsets** (*self, offsets*)  
Set the offsets for the collection.

#### Parameters

##### offsets

[(N, 2) or (2,) array-like]

**set\_path\_effects** (*self, path\_effects*)  
Set the path effects.

#### Parameters

##### path\_effects

[[AbstractPathEffect](#)]

**set\_paths** (*self*)

**set\_picker**(*self, picker*)

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_pickradius**(*self, pr*)

Set the pick radius used for containment tests.

**Parameters****pr**

[float] Pick radius, in points.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_sketch\_params**(*self*, *scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap**(*self*, *snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform**(*self*, *t*)

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url**(*self*, *url*)

Set the url for the artist.

**Parameters**

**url**

[str]

**set\_urls**(*self, urls*)**Parameters****urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set\_visible**(*self, b*)

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder**(*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

### `to_rgba` (*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

### `update` (*self*, *props*)

Update this artist's properties from the dict *props*.

#### Parameters

##### `props`

[dict]

### `property update_dict`

### `update_from` (*self*, *other*)

Copy properties from *other* to *self*.

### `update_scalarmappable` (*self*)

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

### `zorder = 0`

## 18.17 matplotlib.colorbar

Colorbars are a visualization of the mapping from scalar values to colors. In Matplotlib they are drawn into a dedicated [Axes](#).

---

**Note:** Colorbars are typically created through `Figure.colorbar` or its pyplot wrapper `pyplot.colorbar`, which use `make_axes` and `Colorbar` internally.

As an end-user, you most likely won't have to call the methods or instantiate the classes in this module explicitly.

---

### `ColorbarBase`

The base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

### `Colorbar`

On top of `ColorbarBase` this connects the colorbar with a `ScalarMappable` such as an image or contour plot.

#### `make_axes()`

Create an `Axes` suitable for a colorbar. This functions can be used with figures containing a single axes or with freely placed axes.

#### `make_axes_gridspec()`

Create a `SubplotBase` suitable for a colorbar. This function should be used for adding a colorbar to a `GridSpec`.

**class** `matplotlib.colorbar.Colorbar(ax, mappable, **kwargs)`

Bases: `matplotlib.colorbar.ColorbarBase`

This class connects a `ColorbarBase` to a `ScalarMappable` such as an `AxesImage` generated via `imshow`.

---

**Note:** This class is not intended to be instantiated directly; instead, use `Figure.colorbar` or `pyplot.colorbar` to create a colorbar.

---

#### `add_lines(self, CS, erase=True)`

Add the lines from a non-filled `ContourSet` to the colorbar.

#### Parameters

##### `CS`

[`ContourSet`] The line positions are taken from the ContourSet levels. The ContourSet must not be filled.

##### `erase`

[bool, default: True] Whether to remove any previously added lines.

**on\_mappable\_changed(self, mappable)**

[*Deprecated*] Update this colorbar to match the mappable's properties.

Typically this is automatically registered as an event handler by `colorbar_factory()` and should not be called manually.

**Notes**

Deprecated since version 3.3.

**remove(self)**

Remove this colorbar from the figure.

If the colorbar was created with `use_gridspec=True` the previous gridspec is restored.

**update\_bruteforce(self, mappable)**

[*Deprecated*] Destroy and rebuild the colorbar. This is intended to become obsolete, and will probably be deprecated and then removed. It is not called when the `pyplot.colorbar` function or the `Figure.colorbar` method are used to create the colorbar.

**Notes**

Deprecated since version 3.3.

**update\_normal(self, mappable)**

Update solid patches, lines, etc.

This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of `vmin`, `vmax` or `cmap` then the old formatter and locator will be preserved.

```
class matplotlib.colorbar.ColorbarBase(ax, *, cmap=None, norm=None, alpha=None, values=None, boundaries=None, orientation='vertical', ticklocation='auto', extend=None, spacing='uniform', ticks=None, format=None, drawedges=False, filled=True, extendfrac=None, extendrect=False, label='')
```

Bases: `object`

Draw a colorbar in an existing axes.

There are only some rare cases in which you would work directly with a `ColorbarBase` as an end-user. Typically, colorbars are used with `ScalarMappables` such as an `AxesImage` generated via

`imshow`. For these cases you will use `Colorbar` and likely create it via `pypplot.colorbar` or `Figure.colorbar`.

The main application of using a `ColorbarBase` explicitly is drawing colorbars that are not associated with other elements in the figure, e.g. when showing a colormap by itself.

If the `cmap` kwarg is given but `boundaries` and `values` are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the `norm` as:

```
norm=colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm()
```

Useful public methods are `set_label()` and `add_lines()`.

## Parameters

### `ax`

[`Axes`] The `Axes` instance in which the colorbar is drawn.

### `cmap`

[`Colormap`, default: `rcParams["image.cmap"]`] (default: 'viridis')]  
The colormap to use.

### `norm`

[`Normalize`]

### `alpha`

[float] The colorbar transparency between 0 (transparent) and 1 (opaque).

### `values`

### `boundaries`

### `orientation`

[{'vertical', 'horizontal'}]

### `ticklocation`

[{'auto', 'left', 'right', 'top', 'bottom'}]

### `extend`

[{'neither', 'both', 'min', 'max'}]

### `spacing`

[{'uniform', 'proportional'}]

### `ticks`

[`Locator` or array-like of float]

**format**

[str or *Formatter*]

**drawedges**

[bool]

**filled**

[bool]

**extendfrac****extendrec****label**

[str]

**Attributes****ax**

[*Axes*] The *Axes* instance in which the colorbar is drawn.

**lines**

[list] A list of *LineCollection* (empty if no lines were drawn).

**dividers**

[*LineCollection*] A LineCollection (empty if *drawedges* is `False`).

**add\_lines**(*self, levels, colors, linewidths, erase=True*)

Draw lines on the colorbar.

The lines are appended to the list `lines`.

**Parameters****levels**

[array-like] The positions of the lines.

**colors**

[color or list of colors] Either a single color applying to all lines or one color value for each line.

**linewidths**

[float or array-like] Either a single linewidth applying to all lines or one linewidth for each line.

**erase**

[bool, default: True] Whether to remove any previously added lines.

---

```
config_axis(self)
[Deprecated]
```

## Notes

Deprecated since version 3.3:

```
draw_all(self)
```

Calculate any free parameters based on the current cmap and norm, and do all the drawing.

```
get_ticks(self, minor=False)
```

Return the x ticks as a list of locations.

```
minorticks_off(self)
```

Turn the minor ticks of the colorbar off.

```
minorticks_on(self)
```

Turn the minor ticks of the colorbar on without extruding into the "extend regions".

```
n_rasterize = 50
```

```
remove(self)
```

Remove this colorbar from the figure.

```
set_alpha(self, alpha)
```

Set the transparency between 0 (transparent) and 1 (opaque).

```
set_label(self, label, *, loc=None, **kwargs)
```

Add a label to the long axis of the colorbar.

## Parameters

### label

[str] The label text.

### loc

[str, optional] The location of the label.

- For horizontal orientation one of {'left', 'center', 'right'}
- For vertical orientation one of {'bottom', 'center', 'top'}

Defaults to `rcParams["xaxis.labellocation"]` (default: 'center') or `rcParams["yaxis.labellocation"]` (default: 'center') depending on the orientation.

### \*\*kwargs

Keyword arguments are passed to `set_xlabel` / `set_ylabel`. Supported keywords are `labelpad` and `Text` properties.

```
set_ticklabels(self, ticklabels, update_ticks=True)
```

Set tick labels.

Tick labels are updated immediately unless `update_ticks` is `False`, in which case one should call `update_ticks` explicitly.

**set\_ticks** (*self*, *ticks*, *update\_ticks=True*)  
Set tick locations.

### Parameters

#### ticks

[array-like or `Locator` or None] The tick positions can be hard-coded by an array of values; or they can be defined by a `Locator`. Setting to `None` reverts to using a default locator.

#### update\_ticks

[bool, default: True] If True, tick locations are updated immediately. If False, the user has to call `update_ticks` later to update the ticks.

#### update\_ticks(*self*)

Force the update of the ticks and ticklabels. This must be called whenever the tick locator and/or tick formatter changes.

**class** `matplotlib.colorbar.ColorbarPatch` (\*\*kwargs)

Bases: `matplotlib.colorbar.Colorbar`

[Deprecated]

## Notes

Deprecated since version 3.4:

`matplotlib.colorbar.colorbar_factory` (*cax*, *mappable*, \*\*kwargs)

[Deprecated] Create a colorbar on the given axes for the given mappable.

---

**Note:** This is a low-level function to turn an existing axes into a colorbar axes. Typically, you'll want to use `colorbar` instead, which automatically handles creation and placement of a suitable axes as well.

---

### Parameters

#### cax

[`Axes`] The `Axes` to turn into a colorbar.

#### mappable

[`ScalarMappable`] The mappable to be described by the colorbar.

#### \*\*kwargs

Keyword arguments are passed to the respective colorbar class.

## Returns

### `Colorbar`

The created colorbar instance.

## Notes

Deprecated since version 3.4.

```
matplotlib.colorbar.make_axes(parents, location=None, orientation=None, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Create an `Axes` suitable for a colorbar.

The axes is placed in the figure of the `parents` axes, by resizing and repositioning `parents`.

## Parameters

### `parents`

[`Axes` or list of `Axes`] The Axes to use as parents for placing the colorbar.

### `location`

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

### `orientation`

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

### `fraction`

[float, default: 0.15] Fraction of original axes to use for colorbar.

### `shrink`

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

### `aspect`

[float, default: 20] Ratio of long to short dimensions.

## Returns

### `cax`

[`Axes`] The child axes.

**kw**

[dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

**Other Parameters****pad**

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor**

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor**

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

```
matplotlib.colorbar.make_axes_gridspec(parent, *, location=None, orientation=None, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Create a *SubplotBase* suitable for a colorbar.

The axes is placed in the figure of the *parent* axes, by resizing and repositioning *parent*.

This function is similar to *make\_axes*. Primary differences are

- *make\_axes\_gridspec* should only be used with a *SubplotBase* parent.
- *make\_axes* creates an *Axes*; *make\_axes\_gridspec* creates a *SubplotBase*.
- *make\_axes* updates the position of the parent. *make\_axes\_gridspec* replaces the *grid\_spec* attribute of the parent with a new one.

While this function is meant to be compatible with *make\_axes*, there could be some minor differences.

**Parameters****parent**

[*Axes*] The Axes to use as parent for placing the colorbar.

**location**

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

**orientation**

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

**fraction**

[float, default: 0.15] Fraction of original axes to use for colorbar.

**shrink**

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

**aspect**

[float, default: 20] Ratio of long to short dimensions.

**Returns****cax**

[*SubplotBase*] The child axes.

**kw**

[dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

**Other Parameters****pad**

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor**

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor**

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

## 18.18 matplotlib.colors

The Color [tutorials](#) and examples demonstrate how to set colors and colormaps.

A module for converting numbers or color arguments to *RGB* or *RGBA*.

*RGB* and *RGBA* are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap.

Mapping data onto colors using a colormap typically involves two steps: a data array is first mapped onto the range 0-1 using a subclass of [\*Normalize\*](#), then this number is mapped to a color using a subclass of [\*Colormap\*](#). Two subclasses of [\*Colormap\*](#) provided here: [\*LinearSegmentedColormap\*](#), which uses piecewise-linear interpolation to define colormaps, and [\*ListedColormap\*](#), which makes a colormap from a list of colors.

**See also:**

[Creating Colormaps in Matplotlib](#) for examples of how to make colormaps and

[Choosing Colormaps in Matplotlib](#) for a list of built-in colormaps.

[Colormap Normalization](#) for more details about data normalization

More colormaps are available at [palettable](#).

The module also provides functions for checking whether an object can be interpreted as a color ([\*is\\_color\\_like\*](#)), for converting such an object to an RGBA tuple ([\*to\\_rgba\*](#)) or to an HTML-like hex string in the "#rrggbb" format ([\*to\\_hex\*](#)), and a sequence of colors to an (n, 4) RGBA array ([\*to\\_rgba\\_array\*](#)). Caching is used for efficiency.

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA (red, green, blue, alpha) tuple of float values in closed interval [0, 1] (e.g., (0.1, 0.2, 0.5) or (0.1, 0.2, 0.5, 0.3));
- a hex RGB or RGBA string (e.g., '#0f0f0f' or '#0f0f0f80'; case-insensitive);
- a shorthand hex RGB or RGBA string, equivalent to the hex RGB or RGBA string obtained by duplicating each character, (e.g., '#abc', equivalent to '#aabbcc', or '#abcd', equivalent to '#aab-bccdd'; case-insensitive);
- a string representation of a float value in [0, 1] inclusive for gray level (e.g., '0.5');
- one of the characters {'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'}, which are short-hand notations for shades of blue, green, red, cyan, magenta, yellow, black, and white. Note that the colors 'g', 'c', 'm', 'y' do not coincide with the X11/CSS4 colors. Their particular shades were chosen for better visibility of colored lines against typical backgrounds.
- a X11/CSS4 color name (case-insensitive);
- a name from the [xkcd color survey](#), prefixed with 'xkcd:' (e.g., 'xkcd:sky blue'; case insensitive);

- one of the Tableau Colors from the 'T10' categorical palette (the default color cycle): { 'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyan' } (case-insensitive);
- a "CN" color spec, i.e. 'C' followed by a number, which is an index into the default property cycle (`rcParams["axes.prop_cycle"]`) (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

### 18.18.1 Classes

<code>BoundaryNorm(boundaries, ncolors[, clip, extend])</code>	Generate a colormap index based on discrete intervals.
<code>Colormap(name[, N])</code>	Baseclass for all scalar to RGBA mappings.
<code>CenteredNorm([vcenter, halfrange, clip])</code>	Normalize symmetrical data around a center (0 by default).
<code>LightSource([azdeg, altdeg, hsv_min_val, ...])</code>	Create a light source coming from the specified azimuth and elevation.
<code>LinearSegmentedColormap(name, segmentdata[, ...])</code>	Colormap objects based on lookup tables using linear segments.
<code>ListedColormap(colors[, name, N])</code>	Colormap object generated from a list of colors.
<code>LogNorm([vmin, vmax, clip])</code>	
<code>NoNorm([vmin, vmax, clip])</code>	Dummy replacement for <code>Normalize</code> , for the case where we want to use indices directly in a <code>ScalarMappable</code> .
<code>Normalize([vmin, vmax, clip])</code>	A class which, when called, linearly normalizes data into the [0.0, 1.0] interval.
<code>PowerNorm(gamma[, vmin, vmax, clip])</code>	Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.
<code>SymLogNorm(linthresh[, linscale, vmin, ...])</code>	
<code>TwoSlopeNorm(vcenter[, vmin, vmax])</code>	Normalize data with a set center.
<code>FuncNorm(functions[, vmin, vmax, clip])</code>	

#### matplotlib.colors.BoundaryNorm

```
class matplotlib.colors.BoundaryNorm(boundaries, ncolors, clip=False, *, extend='neither')
```

Bases: `matplotlib.colors.Normalize`

Generate a colormap index based on discrete intervals.

Unlike `Normalize` or `LogNorm`, `BoundaryNorm` maps values to integers instead of to the interval 0-1.

Mapping to the 0-1 interval could have been done via piece-wise linear interpolation, but using integers seems simpler, and reduces the number of conversions back and forth between integer and floating

point.

## Parameters

### boundaries

[array-like] Monotonically increasing sequence of at least 2 boundaries.

### ncolors

[int] Number of colors in the colormap to be used.

### clip

[bool, optional] If clip is True, out of range values are mapped to 0 if they are below boundaries[0] or mapped to ncolors - 1 if they are above boundaries[-1].

If clip is False, out of range values are mapped to -1 if they are below boundaries[0] or mapped to ncolors if they are above boundaries[-1]. These are then converted to valid indices by `Colormap.__call__`.

### extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if extend is 'min', then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a `Colorbar` will be drawn with the triangle extension on the left or lower end.

## Returns

### int16 scalar or array

## Notes

*boundaries* defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than *ncolors*, the color index is chosen by linear interpolation, mapping the [0, nbins - 1] range onto the [0, ncolors - 1] range.

### `__call__(self, value, clip=None)`

Normalize *value* data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

## Parameters

### value

Data to normalize.

**clip**

[bool] If None, defaults to `self.clip` (which defaults to False).

**Notes**

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

**`__init__(self, boundaries, ncolors, clip=False, *, extend='neither')`****Parameters****boundaries**

[array-like] Monotonically increasing sequence of at least 2 boundaries.

**ncolors**

[int] Number of colors in the colormap to be used.

**clip**

[bool, optional] If clip is True, out of range values are mapped to 0 if they are below `boundaries[0]` or mapped to `ncolors - 1` if they are above `boundaries[-1]`.

If clip is False, out of range values are mapped to -1 if they are below `boundaries[0]` or mapped to `ncolors` if they are above `boundaries[-1]`. These are then converted to valid indices by `Colormap.__call__`.

**extend**

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if `extend` is 'min', then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a `Colorbar` will be drawn with the triangle extension on the left or lower end.

**Returns****int16 scalar or array**

## Notes

*boundaries* defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than *ncolors*, the color index is chosen by linear interpolation, mapping the  $[0, \text{ nbins} - 1]$  range onto the  $[0, \text{ ncolors} - 1]$  range.

```
__module__ = 'matplotlib.colors'  
inverse(self, value)
```

### Raises

#### ValueError

BoundaryNorm is not invertible, so calling this method will always raise an error

- *Customized Colorbars Tutorial*
- *Colormap Normalization*

## matplotlib.colors.Colormap

```
class matplotlib.colors.Colormap(name, N=256)
```

Bases: `object`

Baseclass for all scalar to RGBA mappings.

Typically, Colormap instances are used to convert data values (floats) from the interval  $[0, 1]$  to the RGBA color that the respective Colormap represents. For scaling of data into the  $[0, 1]$  interval see `matplotlib.colors.Normalize`. Subclasses of `matplotlib.cm.ScalarMappable` make heavy use of this data  $\rightarrow$  normalize  $\rightarrow$  map-to-color processing chain.

### Parameters

#### name

[str] The name of the colormap.

**N**

[int] The number of rgb quantization levels.

**\_\_call\_\_** (*self, X, alpha=None, bytes=False*)

**Parameters****X**

[float or int, ndarray or scalar] The data value(s) to convert to RGBA. For floats, X should be in the interval [0.0, 1.0] to return the RGBA values  $X * 100$  percent along the Colormap line. For integers, X should be in the interval [0, Colormap.N) to return RGBA values *indexed* from the Colormap with index X.

**alpha**

[float or array-like or None] Alpha must be a scalar between 0 and 1, a sequence of such floats with shape matching X, or None.

**bytes**

[bool] If False (default), the returned RGBA values will be floats in the interval [0, 1] otherwise they will be uint8s in the interval [0, 255].

**Returns**

**Tuple of RGBA values if X is scalar, otherwise an array of  
RGBA values with a shape of X.shape + (4, ).**

**\_\_copy\_\_** (*self*)

**\_\_dict\_\_** = `mappingproxy({ '__module__': 'matplotlib.colors', '__doc__': '\n Bas`

**\_\_init\_\_** (*self, name, N=256*)

**Parameters****name**

[str] The name of the colormap.

**N**

[int] The number of rgb quantization levels.

**\_\_module\_\_** = `'matplotlib.colors'`

**\_\_weakref\_\_**

list of weak references to the object (if defined)

**colorbar\_extend**

When this colormap exists on a scalar mappable and colorbar\_extend is not False, colorbar creation will pick up colorbar\_extend as the default value for the extend keyword in the `matplotlib.colorbar.Colorbar` constructor.

**copy(self)**

Return a copy of the colormap.

**get\_bad(self)**

Get the color for masked values.

**get\_over(self)**

Get the color for high out-of-range values.

**get\_under(self)**

Get the color for low out-of-range values.

**is\_gray(self)**

Return whether the colormap is grayscale.

**reversed(self, name=None)**

Return a reversed instance of the Colormap.

---

**Note:** This function is not implemented for base class.

---

## Parameters

**name**

[str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "\_r".

**See also:**

`LinearSegmentedColormap.reversed`

`ListedColormap.reversed`

**set\_bad(self, color='k', alpha=None)**

Set the color for masked values.

**set\_extremes(self, \*, bad=None, under=None, over=None)**

Set the colors for masked (*bad*) values and, when norm.clip = False, low (*under*) and high (*over*) out-of-range values.

**set\_over(self, color='k', alpha=None)**

Set the color for high out-of-range values.

**set\_under(self, color='k', alpha=None)**

Set the color for low out-of-range values.

**with\_extremes** (*self*, \*, *bad=None*, *under=None*, *over=None*)

Return a copy of the colormap, for which the colors for masked (*bad*) values and, when *norm.clip* = *False*, low (*under*) and high (*over*) out-of-range values, have been set accordingly.

## Examples using matplotlib.colors.Colormap

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_multicolored\_line.py
- sphx\_glr\_gallery\_color\_custom\_cmap.py

- *Customized Colorbars Tutorial*
- *Creating Colormaps in Matplotlib*

## matplotlib.colors.CenteredNorm

**class** matplotlib.colors.CenteredNorm(*vcenter=0*, *halfrange=None*, *clip=False*)

Bases: *matplotlib.colors.Normalize*

Normalize symmetrical data around a center (0 by default).

Unlike *TwoSlopeNorm*, *CenteredNorm* applies an equal rate of change around the center.

Useful when mapping symmetrical data around a conceptual center e.g., data that range from -2 to 4, with 0 as the midpoint, and with equal rates of change around that midpoint.

### Parameters

#### vcenter

[float, default: 0] The data value that defines 0.5 in the normalization.

#### halfrange

[float, optional] The range of data values that defines a range of 0.5 in the normalization, so that *vcenter - halfrange* is 0.0 and *vcenter + halfrange* is 1.0 in the normalization. Defaults to the largest absolute difference to *vcenter* for the values in the dataset.

## Examples

This maps data values -2 to 0.25, 0 to 0.5, and 4 to 1.0 (assuming equal rates of change above and below 0.0):

```
>>> import matplotlib.colors as mcolors
>>> norm = mcolors.CenteredNorm(halfrange=4.0)
>>> data = [-2., 0., 4.]
>>> norm(data)
array([0.25, 0.5 , 1.  ])
```

### `__call__(self, value, clip=None)`

Normalize `value` data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

#### Parameters

##### `value`

Data to normalize.

##### `clip`

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

## Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

### `__init__(self, vcenter=0, halfrange=None, clip=False)`

Normalize symmetrical data around a center (0 by default).

Unlike `TwoSlopeNorm`, `CenteredNorm` applies an equal rate of change around the center.

Useful when mapping symmetrical data around a conceptual center e.g., data that range from -2 to 4, with 0 as the midpoint, and with equal rates of change around that midpoint.

#### Parameters

##### `vcenter`

[float, default: 0] The data value that defines 0.5 in the normalization.

##### `halfrange`

[float, optional] The range of data values that defines a range of 0.5 in the normalization, so that `vcenter - halfrange` is 0.0 and `vcenter + halfrange` is 1.0 in the normalization. Defaults to the largest absolute difference to `vcenter` for the values in the dataset.

## Examples

This maps data values -2 to 0.25, 0 to 0.5, and 4 to 1.0 (assuming equal rates of change above and below 0.0):

```
>>> import matplotlib.colors as mcolors
>>> norm = mcolors.CenteredNorm(halfrange=4.0)
>>> data = [-2., 0., 4.]
>>> norm(data)
array([0.25, 0.5, 1.])
```

```
__module__ = 'matplotlib.colors'
```

```
autoscale(self, A)
    Set halfrange to max (abs (A-vcenter) ), then set vmin and vmax.

autoscale_None(self, A)
    Set vmin and vmax.

property halfrange
property vcenter
```

## Examples using `matplotlib.colors.CenteredNorm`

- *Colormap Normalization*

## `matplotlib.colors.LightSource`

```
class matplotlib.colors.LightSource(azdeg=315,      altdeg=45,      hsv_min_val=0,
                                         hsv_max_val=1,      hsv_min_sat=1,
                                         hsv_max_sat=0)
```

Bases: `object`

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

`shade` is used to produce "shaded" rgb values for a data array. `shade_rgb` can be used to combine an rgb image with an elevation map. `hillshade` produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

### Parameters

#### `azdeg`

[float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

#### `altdeg`

[float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

## Notes

For backwards compatibility, the parameters `hsv_min_val`, `hsv_max_val`, `hsv_min_sat`, and `hsv_max_sat` may be supplied at initialization as well. However, these parameters will only be used if "`blend_mode='hsv'`" is passed into `shade` or `shade_rgb`. See the documentation for `blend_hsv` for more details.

```
__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '\n Create\n\nParameters\nazdeg\naltdeg\n\nNotes\n\nSee also\nblend_hsv\n\nExamples\n\nA shaded relief map.\n\nimport numpy as np\nimport matplotlib.pyplot as plt\nfrom matplotlib import cm\n\n# Create a 2D grid of points\nx = np.linspace(-10, 10, 200)\ny = np.linspace(-10, 10, 200)\nx, y = np.meshgrid(x, y)\n\n# Create a shaded relief map\nz = np.sin(np.sqrt(x**2 + y**2))\n\n# Create a color map\nnorm = plt.Normalize(vmin=-1, vmax=1)\ncolors = cm.ScalarMappable(norm=norm, cmap=cm.Reds)\nshaded = colors.to_rgba(z)\n\n# Plot the shaded relief map\nplt.imshow(shaded)\nplt.show()
```

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

### Parameters

#### azdeg

[float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

#### altdeg

[float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

## Notes

For backwards compatibility, the parameters `hsv_min_val`, `hsv_max_val`, `hsv_min_sat`, and `hsv_max_sat` may be supplied at initialization as well. However, these parameters will only be used if "`blend_mode='hsv'`" is passed into `shade` or `shade_rgb`. See the documentation for `blend_hsv` for more details.

```
__module__ = 'matplotlib.colors'
```

```
__weakref__
```

list of weak references to the object (if defined)

```
blend_hsv(self,      rgb,      intensity,      hsv_max_sat=None,      hsv_max_val=None,\n           hsv_min_val=None, hsv_min_sat=None)
```

Take the input data array, convert to HSV values in the given colormap, then adjust those color values to give the impression of a shaded relief map with a specified light source. RGBA values are returned, which can then be used to plot the shaded image with imshow.

The color of the resulting image will be darkened by moving the (s, v) values (in hsv colorspace) toward (hsv\_min\_sat, hsv\_min\_val) in the shaded regions, or lightened by sliding (s, v) toward (hsv\_max\_sat, hsv\_max\_val) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black (s = 1, v = 0) and completely illuminated points are nearly white (s = 0, v = 1).

### Parameters

#### rgb

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

### intensity

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

### hsv\_max\_sat

[number, default: 1] The maximum saturation value that the *intensity* map can shift the output image to.

### hsv\_min\_sat

[number, optional] The minimum saturation value that the *intensity* map can shift the output image to. Defaults to 0.

### hsv\_max\_val

[number, optional] The maximum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 1.

### hsv\_min\_val

[number, optional] The minimum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 0.

## Returns

### ndarray

An MxNx3 RGB array representing the combined images.

### blend\_overlay(*self, rgb, intensity*)

Combines an *rgb* image with an *intensity* map using "overlay" blending.

## Parameters

### rgb

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

### intensity

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

## Returns

### ndarray

An MxNx3 RGB array representing the combined images.

### blend\_soft\_light(*self, rgb, intensity*)

Combine an *rgb* image with an *intensity* map using "soft light" blending, using the "pegtop" formula.

## Parameters

**rgb**

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity**

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**Returns****ndarray**

An MxNx3 RGB array representing the combined images.

**property direction**

The unit vector direction towards the light source.

**hillshade (self, elevation, vert\_exag=1, dx=1, dy=1, fraction=1.0)**

Calculate the illumination intensity for a surface using the defined azimuth and elevation for the light source.

This computes the normal vectors for the surface, and then passes them on to *shade\_normals*

**Parameters****elevation**

[2D array-like] The height values used to generate an illumination map

**vert\_exag**

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topographic effects.

**dx**

[number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy**

[number, optional] The y-spacing (rows) of the input *elevation* grid.

**fraction**

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**Returns****ndarray**

A 2D array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

```
shade(self, data, cmap, norm=None, blend_mode='overlay', vmin=None, vmax=None,
      vert_exag=1, dx=1, dy=1, fraction=1, **kwargs)
Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the
values.
```

## Parameters

### data

[2D array-like] The height values used to generate a shaded map.

### cmap

[[Colormap](#)] The colormap used to color the *data* array. Note that this must be a [Colormap](#) instance. For example, rather than passing `in cmap='gist_earth'`, use `cmap=plt.get_cmap('gist_earth')` instead.

### norm

[[Normalize](#) instance, optional] The normalization used to scale values before colormapping. If *None*, the input will be linearly scaled between its min and max.

### blend\_mode

[{'hsv', 'overlay', 'soft'} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. Default is "overlay". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend\_mode* function.

### vmin

[float or *None*, optional] The minimum value used in colormapping *data*. If *None* the minimum value in *data* is used. If *norm* is specified, then this argument will be ignored.

### vmax

[float or *None*, optional] The maximum value used in colormapping *data*. If *None* the maximum value in *data* is used. If *norm* is specified, then this argument will be ignored.

### vert\_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units

between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

**dx**

[number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy**

[number, optional] The y-spacing (rows) of the input *elevation* grid.

**fraction**

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**Additional kwargs are passed on to the \*blend\_mode\* function.**

**Returns****ndarray**

An MxNx4 array of floats ranging between 0-1.

**shade\_normals (self, normals, fraction=1.0)**

Calculate the illumination intensity for the normal vectors of a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

**Parameters****fraction**

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**Returns****ndarray**

A 2D array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

**shade\_rgb (self, rgb, elevation, fraction=1.0, blend\_mode='hsv', vert\_exag=1, dx=1, dy=1, \*\*kwargs)**

Use this light source to adjust the colors of the *rgb* input array to give the impression of a shaded relief map with the given *elevation*.

## Parameters

### rgb

[array-like] An (M, N, 3) RGB array, assumed to be in the range of 0 to 1.

### elevation

[array-like] An (M, N) array of the height values used to generate a shaded map.

### fraction

[number] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

### blend\_mode

[{'hsv', 'overlay', 'soft'} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. For backwards compatibility, this defaults to "hsv". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the `blend_mode` function.

### vert\_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

### dx

[number, optional] The x-spacing (columns) of the input *elevation* grid.

### dy

[number, optional] The y-spacing (rows) of the input *elevation* grid.

**Additional kwargs are passed on to the \*blend\_mode\* function.**

## Returns

### ndarray

An (m, n, 3) array of floats ranging between 0-1.

## Examples using `matplotlib.colors.LightSource`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_shading\_example.py
- sphx\_glr\_gallery\_showcase\_mandelbrot.py
- sphx\_glr\_gallery\_frontpage\_3D.py
- sphx\_glr\_gallery\_misc\_demo\_agg\_filter.py
- sphx\_glr\_gallery\_mplot3d\_custom\_shaded\_3d\_surface.py
- sphx\_glr\_gallery\_specialty\_plots\_advanced\_hillshading.py
- sphx\_glr\_gallery\_specialty\_plots\_topographic\_hillshading.py

## `matplotlib.colors.LinearSegmentedColormap`

```
class matplotlib.colors.LinearSegmentedColormap(name, segmentdata, N=256,
                                               gamma=1.0)
```

Bases: `matplotlib.colors.Colormap`

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create colormap from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of  $x, y0, y1$  tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```
cdict = {'red': [(0.0, 0.0, 0.0),
                 (0.5, 1.0, 1.0),
                 (1.0, 1.0, 1.0)],

         'green': [(0.0, 0.0, 0.0),
                    (0.25, 0.0, 0.0),
                    (0.75, 1.0, 1.0),
                    (1.0, 1.0, 1.0)],

         'blue': [(0.0, 0.0, 0.0),
                   (0.5, 0.0, 0.0),
                   (1.0, 1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of  $x, y0, y1$  tuples. In each sequence,  $x$  must increase monotonically from 0 to 1. For any input value  $z$  falling between  $x[i]$  and  $x[i+1]$ , the output value of a given color will be linearly interpolated between  $y1[i]$  and  $y0[i+1]$ :

```

row i:   x  y0  y1
        /
        /
row i+1: x  y0  y1

```

Hence  $y_0$  in the first row and  $y_1$  in the last row are never used.

**See also:**

[\*LinearSegmentedColormap.from\\_list\*](#)

Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

**`__init__`** (*self, name, segmentdata, N=256, gamma=1.0*)

Create colormap from linear mapping segments

`segmentdata` argument is a dictionary with a red, green and blue entries. Each entry should be a list of  $x, y_0, y_1$  tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```

cdict = {'red': [(0.0, 0.0, 0.0),
                 (0.5, 1.0, 1.0),
                 (1.0, 1.0, 1.0)],

          'green': [(0.0, 0.0, 0.0),
                     (0.25, 0.0, 0.0),
                     (0.75, 1.0, 1.0),
                     (1.0, 1.0, 1.0)],

          'blue': [(0.0, 0.0, 0.0),
                    (0.5, 0.0, 0.0),
                    (1.0, 1.0, 1.0)]}

```

Each row in the table for a given color is a sequence of  $x, y_0, y_1$  tuples. In each sequence,  $x$  must increase monotonically from 0 to 1. For any input value  $z$  falling between  $x[i]$  and  $x[i+1]$ , the output value of a given color will be linearly interpolated between  $y_1[i]$  and  $y_0[i+1]$ :

```

row i:   x  y0  y1
        /
        /
row i+1: x  y0  y1

```

Hence  $y_0$  in the first row and  $y_1$  in the last row are never used.

**See also:**

[\*LinearSegmentedColormap.from\\_list\*](#)

Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

```
__module__ = 'matplotlib.colors'  
static from_list(name, colors, N=256, gamma=1.0)  
    Create a LinearSegmentedColormap from a list of colors.
```

### Parameters

#### **name**

[str] The name of the colormap.

#### **colors**

[array-like of colors or array-like of (value, color)] If only colors are given, they are equidistantly mapped from the range [0, 1]; i.e. 0 maps to `colors[0]` and 1 maps to `colors[-1]`. If (value, color) pairs are given, the mapping is from *value* to *color*. This can be used to divide the range unevenly.

#### **N**

[int] The number of rgb quantization levels.

#### **gamma**

[float]

#### **reversed**(*self*, *name=None*)

Return a reversed instance of the Colormap.

### Parameters

#### **name**

[str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "\_r".

### Returns

#### **LinearSegmentedColormap**

The reversed colormap.

#### **set\_gamma**(*self*, *gamma*)

Set a new gamma value and regenerate colormap.

### matplotlib.colors.ListedColormap

**class** `matplotlib.colors.ListedColormap(colors, name='from_list', N=None)`

Bases: `matplotlib.colors.Colormap`

Colormap object generated from a list of colors.

This may be most useful when indexing directly into a colormap, but it can also be used to generate special colormaps for ordinary mapping.

#### Parameters

##### colors

[list, array] List of Matplotlib color specifications, or an equivalent Nx3 or Nx4 floating point array ( $N$  rgb or rgba values).

**name**

[str, optional] String to identify the colormap.

**N**

[int, optional] Number of entries in the map. The default is *None*, in which case there is one colormap entry for each element in the list of colors. If

```
N < len(colors)
```

the list will be truncated at *N*. If

```
N > len(colors)
```

the list will be extended by repetition.

**Parameters****name**

[str] The name of the colormap.

**N**

[int] The number of rgb quantization levels.

```
__init__(self, colors, name='from_list', N=None)
```

**Parameters****name**

[str] The name of the colormap.

**N**

[int] The number of rgb quantization levels.

```
__module__ = 'matplotlib.colors'
```

```
reversed(self, name=None)
```

Return a reversed instance of the Colormap.

**Parameters****name**

[str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "\_r".

**Returns**

## ListedColormap

A reversed instance of the colormap.

## `matplotlib.colors.LogNorm`

**class** `matplotlib.colors.LogNorm(vmin=None, vmax=None, clip=False)`

Bases: `matplotlib.colors.LogNorm`

**\_\_call\_\_(self, value, clip=None)**

Normalize `value` data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

### Parameters

#### **value**

Data to normalize.

#### **clip**

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

## Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

**`__init__(self, vmin=None, vmax=None, clip=False)`**

### Parameters

#### `vmin, vmax`

[float or None] If `vmin` and/or `vmax` is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

#### `clip`

[bool, default: False] If `True` values falling outside the range [`vmin`, `vmax`], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

## Notes

Returns 0 if `vmin == vmax`.

**`__module__ = 'matplotlib.colors'`**  
**`inverse(self, value)`**

## Examples using `matplotlib.colors.LogNorm`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_pcolor\_demo.py
- sphx\_glr\_gallery\_statistics\_hist.py
- sphx\_glr\_gallery\_statistics\_time\_series\_histogram.py
- sphx\_glr\_gallery\_userdemo\_colormap\_normalizations.py
- *Colormap Normalization*

**matplotlib.colors.NoNorm**

**class** `matplotlib.colors.NoNorm(vmin=None, vmax=None, clip=False)`

Bases: `matplotlib.colors.Normalize`

Dummy replacement for `Normalize`, for the case where we want to use indices directly in a `ScalarMappable`.

**Parameters****vmin, vmax**

[float or None] If `vmin` and/or `vmax` is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip**

[bool, default: False] If True values falling outside the range [`vmin`, `vmax`], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

**Notes**

Returns 0 if `vmin == vmax`.

**\_\_call\_\_(self, value, clip=None)**

Normalize `value` data in the [`vmin`, `vmax`] interval into the [0.0, 1.0] interval and return it.

**Parameters****value**

Data to normalize.

**clip**

[bool] If None, defaults to `self.clip` (which defaults to False).

## Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

```
__module__ = 'matplotlib.colors'
inverse(self, value)
```

## Examples using `matplotlib.colors.NoNorm`

### `matplotlib.colors.Normalize`

```
class matplotlib.colors.Normalize(vmin=None, vmax=None, clip=False)
Bases: object
```

A class which, when called, linearly normalizes data into the [0.0, 1.0] interval.

#### Parameters

##### `vmin, vmax`

[float or None] If `vmin` and/or `vmax` is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

##### `clip`

[bool, default: False] If True values falling outside the range [`vmin`, `vmax`], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

## Notes

Returns 0 if `vmin == vmax`.

`__call__(self, value, clip=None)`

Normalize `value` data in the [`vmin`, `vmax`] interval into the [0.0, 1.0] interval and return it.

#### Parameters

##### `value`

Data to normalize.

**clip**

[bool] If None, defaults to `self.clip` (which defaults to False).

**Notes**

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

```
__dict__ = mappingproxy({ '__module__': 'matplotlib.colors', '__doc__': '\n A c\n\n    __init__(self, vmin=None, vmax=None, clip=False)
```

**Parameters****vmin, vmax**

[float or None] If `vmin` and/or `vmax` is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip**

[bool, default: False] If True values falling outside the range [`vmin`, `vmax`], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

**Notes**

Returns 0 if `vmin == vmax`.

```
__module__ = 'matplotlib.colors'
```

```
__weakref__
```

list of weak references to the object (if defined)

```
autoscale(self, A)
```

Set `vmin, vmax` to min, max of `A`.

```
autoscale_None(self, A)
```

If `vmin` or `vmax` are not set, use the min/max of `A` to set them.

```
inverse(self, value)
```

```
static process_value(value)
```

Homogenize the input `value` for easy and efficient normalization.

`value` can be a scalar or sequence.

**Returns**

**result**

[masked array] Masked array with the same shape as *value*.

**is\_scalar**

[bool] Whether *value* is a scalar.

**Notes**

Float dtypes are preserved; integer types with two bytes or smaller are converted to np.float32, and larger types are converted to np.float64. Preserving float32 when possible, and using in-place operations, greatly improves speed for large arrays.

**scaled (self)**

Return whether vmin and vmax are set.

### `matplotlib.colors.PowerNorm`

**class** `matplotlib.colors.PowerNorm`(*gamma*, *vmin=None*, *vmax=None*, *clip=False*)  
Bases: `matplotlib.colors.Normalize`

Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.

#### Parameters

##### `vmin, vmax`

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

##### `clip`

[bool, default: False] If True values falling outside the range [*vmin*, *vmax*], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

#### Notes

Returns 0 if *vmin* == *vmax*.

#### `__call__(self, value, clip=None)`

Normalize *value* data in the [*vmin*, *vmax*] interval into the [0.0, 1.0] interval and return it.

#### Parameters

##### `value`

Data to normalize.

##### `clip`

[bool] If None, defaults to `self.clip` (which defaults to False).

## Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__init__(self, gamma, vmin=None, vmax=None, clip=False)`

### Parameters

#### vmin, vmax

[float or None] If `vmin` and/or `vmax` is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

#### clip

[bool, default: False] If `True` values falling outside the range [`vmin`, `vmax`], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

## Notes

Returns 0 if `vmin == vmax`.

`__module__ = 'matplotlib.colors'`  
`inverse(self, value)`

## Examples using `matplotlib.colors.PowerNorm`

- sphx\_glr\_gallery\_showcase\_mandelbrot.py
- sphx\_glr\_gallery\_scales\_power\_norm.py
- sphx\_glr\_gallery\_userdemo\_colormap\_normalizations.py
- *Colormap Normalization*

**matplotlib.colors.SymLogNorm**

```
class matplotlib.colors.SymLogNorm(linthresh,      linscale=1.0,      vmin=None,
                                    vmax=None, clip=False, *, base=10)
```

Bases: *matplotlib.colors.SymLogNorm*

**\_\_call\_\_** (*self*, *value*, *clip=None*)

Normalize *value* data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

**Parameters****value**

Data to normalize.

**clip**

[bool] If None, defaults to *self.clip* (which defaults to False).

**Notes**

If not already initialized, *self.vmin* and *self.vmax* are initialized using *self.autoscale\_None*(*value*).

**\_\_init\_\_** (*self*, *linthresh*, *linscale=1.0*, *vmin=None*, *vmax=None*, *clip=False*, \*, *base=10*)

**Parameters****vmin, vmax**

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., *\_\_call\_\_*(*A*) calls *autoscale\_None*(*A*).

**clip**

[bool, default: False] If True values falling outside the range [vmin, vmax], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is *clip=False*.

## Notes

Returns 0 if `vmin == vmax`.

```
__module__ = 'matplotlib.colors'
inverse(self, value)
```

## Examples using `matplotlib.colors.SymLogNorm`

- sphx\_glr\_gallery\_userdemo\_colormap\_normalizations.py
- sphx\_glr\_gallery\_userdemo\_colormap\_normalizations\_symlognorm.py
- *Colormap Normalization*

## `matplotlib.colors.TwoSlopeNorm`

```
class matplotlib.colors.TwoSlopeNorm(vcenter, vmin=None, vmax=None)
Bases: matplotlib.colors.Normalize
```

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

### Parameters

#### `vcenter`

[float] The data value that defines 0.5 in the normalization.

#### `vmin`

[float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

#### `vmax`

[float, optional] The data value that defines 1.0 in the normalization. Defaults to the max value of the dataset.

## Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
...                                 vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

### `__call__(self, value, clip=None)`

Map value to the interval [0, 1]. The clip argument is unused.

### `__init__(self, vcenter, vmin=None, vmax=None)`

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

#### Parameters

##### `vcenter`

[float] The data value that defines 0.5 in the normalization.

##### `vmin`

[float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

##### `vmax`

[float, optional] The data value that defines 1.0 in the normalization. Defaults to the max value of the dataset.

## Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
...                                 vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

### `__module__ = 'matplotlib.colors'`

### `autoscale_None(self, A)`

Get vmin and vmax, and then clip at vcenter

## Examples using `matplotlib.colors.TwoSlopeNorm`

- *Colormap Normalization*

## matplotlib.colors.FuncNorm

```
class matplotlib.colors.FuncNorm(functions, vmin=None, vmax=None, clip=False)
Bases: matplotlib.colors.FuncNorm

__call__(self, value, clip=None)
    Normalize value data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.
```

### Parameters

#### value

Data to normalize.

#### clip

[bool] If None, defaults to self.clip (which defaults to False).

### Notes

If not already initialized, self.vmin and self.vmax are initialized using self.autoscale\_None(value).

```
__init__(self, functions, vmin=None, vmax=None, clip=False)
```

### Parameters

#### vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., \_\_call\_\_(A) calls autoscale\_None(A).

#### clip

[bool, default: False] If True values falling outside the range [vmin, vmax], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is clip=False.

### Notes

Returns 0 if `vmin == vmax`.

```
__module__ = 'matplotlib.colors'
inverse(self, value)
```

### Examples using `matplotlib.colors.FuncNorm`

- *Colormap Normalization*

## 18.18.2 Functions

<code>from_levels_and_colors(levels, colors[, extend])</code>	A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.
<code>hsv_to_rgb(hsv)</code>	Convert hsv values to rgb.
<code>rgb_to_hsv(arr)</code>	Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.
<code>to_hex(c[, keep_alpha])</code>	Convert <code>c</code> to a hex color.
<code>to_rgb(c)</code>	Convert <code>c</code> to an RGB color, silently dropping the alpha channel.
<code>to_rgba(c[, alpha])</code>	Convert <code>c</code> to an RGBA color.
<code>to_rgba_array(c[, alpha])</code>	Convert <code>c</code> to a (n, 4) array of RGBA colors.
<code>is_color_like(c)</code>	Return whether <code>c</code> can be interpreted as an RGB(A) color.
<code>same_color(c1, c2)</code>	Return whether the colors <code>c1</code> and <code>c2</code> are the same.
<code>get_named_colors_mapping()</code>	Return the global mapping of names to named colors.

### `matplotlib.colors.from_levels_and_colors`

```
matplotlib.colors.from_levels_and_colors(levels, colors, extend='neither')
```

A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.

#### Parameters

##### `levels`

[sequence of numbers] The quantization levels used to construct the `BoundaryNorm`. Value `v` is quantized to level `i` if `lev[i] <= v < lev[i+1]`.

##### `colors`

[sequence of colors] The fill color to use for each level. If `extend` is "neither" there

must be `n_level` – 1 colors. For an `extend` of "min" or "max" add one extra color, and for an `extend` of "both" add two colors.

**extend**

[{'neither', 'min', 'max', 'both'}, optional] The behaviour when a value falls out of range of the given levels. See `contourf` for details.

**Returns****cmap**

[`Normalize`]

**norm**

[`Colormap`]

**Examples using `matplotlib.colors.from_levels_and_colors`****`matplotlib.colors.hsv_to_rgb`**

`matplotlib.colors.hsv_to_rgb(hsv)`

Convert hsv values to rgb.

**Parameters****hsv**

[(..., 3) array-like] All values assumed to be in range [0, 1]

**Returns****(..., 3) ndarray**

Colors converted to RGB values in range [0, 1]

**Examples using `matplotlib.colors.hsv_to_rgb`**

- sphx\_glr\_gallery\_mplot3d\_voxels\_torus.py

### `matplotlib.colors.rgb_to_hsv`

`matplotlib.colors.rgb_to_hsv(arr)`

Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.

#### Parameters

`arr`

[..., 3) array-like] All values must be in the range [0, 1]

#### Returns

(..., 3) ndarray

Colors converted to hsv values in range [0, 1]

### Examples using `matplotlib.colors.rgb_to_hsv`

- sphx\_glr\_gallery\_color\_named\_colors.py

### `matplotlib.colors.to_hex`

`matplotlib.colors.to_hex(c, keep_alpha=False)`

Convert `c` to a hex color.

Uses the #rrggbb format if `keep_alpha` is False (the default), #rrggbbaa otherwise.

### Examples using `matplotlib.colors.to_hex`

### `matplotlib.colors.to_rgb`

`matplotlib.colors.to_rgb(c)`

Convert `c` to an RGB color, silently dropping the alpha channel.

### Examples using `matplotlib.colors.to_rgb`

- sphx\_glr\_gallery\_color\_named\_colors.py

## matplotlib.colors.to\_rgba

`matplotlib.colors.to_rgba(c, alpha=None)`

Convert *c* to an RGBA color.

### Parameters

**c**

[Matplotlib color or `np.ma.masked`]

**alpha**

[float, optional] If *alpha* is not `None`, it forces the alpha value, except if *c* is "none" (case-insensitive), which always maps to `(0, 0, 0, 0)`.

### Returns

**tuple**

Tuple of `(r, g, b, a)` scalars.

## Examples using `matplotlib.colors.to_rgba`

- sphx\_glr\_gallery\_shapes\_and\_collections\_collections.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_line\_collection.py
- sphx\_glr\_gallery\_event\_handling\_lasso\_demo.py
- sphx\_glr\_gallery\_misc\_demo\_ribbon\_box.py

## matplotlib.colors.to\_rgba\_array

`matplotlib.colors.to_rgba_array(c, alpha=None)`

Convert *c* to a `(n, 4)` array of RGBA colors.

### Parameters

**c**

[Matplotlib color or array of colors] If *c* is a masked array, an ndarray is returned with a `(0, 0, 0, 0)` row for each masked value or row in *c*.

**alpha**

[float or sequence of floats, optional] If *alpha* is not `None`, it forces the alpha value, except if *c* is "none" (case-insensitive), which always maps to `(0, 0, 0, 0)`. If *alpha* is a sequence and *c* is a single color, *c* will be repeated to match the length of *alpha*.

### Returns

### array

(n, 4) array of RGBA colors.

## Examples using `matplotlib.colors.to_rgba_array`

### `matplotlib.colors.is_color_like`

`matplotlib.colors.is_color_like(c)`

Return whether *c* can be interpreted as an RGB(A) color.

## Examples using `matplotlib.colors.is_color_like`

### `matplotlib.colors.same_color`

`matplotlib.colors.same_color(c1, c2)`

Return whether the colors *c1* and *c2* are the same.

*c1, c2* can be single colors or lists/arrays of colors.

## Examples using `matplotlib.colors.same_color`

### `matplotlib.colors.get_named_colors_mapping`

`matplotlib.colors.get_named_colors_mapping()`

Return the global mapping of names to named colors.

## Examples using `matplotlib.colors.get_named_colors_mapping`

## 18.19 `matplotlib.container`

`class matplotlib.container.BarContainer(*args, **kwargs)`

Bases: `matplotlib.container.Container`

Container for the artists of bar plots (e.g. created by `Axes.bar`).

The container can be treated as a tuple of the *patches* themselves. Additionally, you can access these and further parameters by the attributes.

### Attributes

#### patches

[list of `Rectangle`] The artists of the bars.

**errorbar**

[None or [ErrorbarContainer](#)] A container for the error bar artists if error bars are present. *None* otherwise.

**datavals**

[None or array-like] The underlying data values corresponding to the bars.

**orientation**

[{'vertical', 'horizontal'}, default: None] If 'vertical', the bars are assumed to be vertical. If 'horizontal', the bars are assumed to be horizontal.

**class** `matplotlib.container.Container(*args, **kwargs)`

Bases: `tuple`

Base class for containers.

Containers are classes that collect semantically related Artists such as the bars of a bar plot.

**add\_callback(self, func)**

Add a callback function that will be called whenever one of the [Artist](#)'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling [Artist](#). Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with [remove\\_callback](#) later.

**See also:**

[`remove\_callback`](#)

[`get\_children\(self\)`](#)

[`get\_label\(self\)`](#)

Return the label used for this artist in the legend.

[`pchanged\(self\)`](#)

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

[`add\_callback`](#)

[`remove\_callback`](#)

`remove(self)`

`remove_callback(self, oid)`

Remove a callback based on its observer id.

See also:

[`add\_callback`](#)

`set_label(self, s)`

Set a label that will be displayed in the legend.

### Parameters

`s`

[object] `s` will be converted to a string by calling `str`.

**class** `matplotlib.container.ErrorbarContainer(*args, **kwargs)`

Bases: `matplotlib.container.Container`

Container for the artists of error bars (e.g. created by `Axes.errorbar`).

The container can be treated as the `lines` tuple itself. Additionally, you can access these and further parameters by the attributes.

### Attributes

#### `lines`

[tuple] Tuple of (`data_line`, `caplines`, `barlinecols`).

- `data_line` : `Line2D` instance of x, y plot markers and/or line.
- `caplines` : tuple of `Line2D` instances of the error bar caps.
- `barlinecols` : list of `LineCollection` with the horizontal and vertical error ranges.

#### `has_xerr, has_yerr`

[bool] True if the errorbar has x/y errors.

**class** `matplotlib.container.StemContainer(*args, **kwargs)`

Bases: `matplotlib.container.Container`

Container for the artists created in a `Axes.stem()` plot.

The container can be treated like a namedtuple (`markerline`, `stemlines`, `baseline`).

## Attributes

### **markerline**

[[Line2D](#)] The artist of the markers at the stem heads.

### **stemlines**

[list of [Line2D](#)] The artists of the vertical lines for all stems.

### **baseline**

[[Line2D](#)] The artist of the horizontal baseline.

## Parameters

### **markerline\_stemlines\_baseline**

[tuple] Tuple of (markerline, stemlines, baseline). markerline contains the [LineCollection](#) of the markers, stemlines is a [LineCollection](#) of the main lines, baseline is the [Line2D](#) of the baseline.

## 18.20 matplotlib.contour

Classes to support contour plotting and labelling for the Axes class.

```
class matplotlib.contour.ClLabelText(x=0, y=0, text='', color=None, verticalalignment='baseline', horizontalalignment='left', multialignment=None, fontproperties=None, rotation=None, linespacing=None, rotation_mode=None, usetex=None, wrap=False, transform_rotates_text=False, **kwargs)
```

Bases: [matplotlib.text.Text](#)

Unlike the ordinary text, the `get_rotation` returns an updated angle in the pixel coordinate assuming that the input rotation is an angle in data coordinate (or whatever transform set).

Create a [Text](#) instance at `x, y` with string `text`.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) uint8 array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <a href="#">patches.FancyBboxPatch</a>
<code>clip_box</code>	<a href="#">Bbox</a>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None

Table 132 – continued from pr

Property	Description
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code> or <code>family</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code> or <code>font</code> or <code>font_properties</code>	<code>font_manager.FontProperties</code> or <code>str</code> or <code>pathlib.Path</code>
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'normal'}
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'bold'}
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>math_fontfamily</code>	str
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>text</code>	object
<code>transform</code>	<code>Transform</code>
<code>transform_rotates_text</code>	bool
<code>url</code>	str
<code>usetex</code>	bool or None
<code>verticalalignment</code> or <code>va</code>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<code>visible</code>	bool
<code>wrap</code>	bool
<code>x</code>	float
<code>y</code>	float
<code>zorder</code>	float

`get_rotation(self)`

Return the text angle in degrees between 0 and 360.

`class matplotlib.contour.ContourLabeler`

Bases: `object`

Mixin to provide labelling capability to `ContourSet`.

**add\_label** (*self*, *x*, *y*, *rotation*, *lev*, *cvalue*)

Add contour label using `Text` class.

**add\_label\_clabelfont** (*self*, *x*, *y*, *rotation*, *lev*, *cvalue*)

Add contour label using `Clabelfont` class.

**add\_label\_near** (*self*, *x*, *y*, *inline=True*, *inline\_spacing=5*, *transform=None*)

Add a label near the point (*x*, *y*).

## Parameters

**x, y**

[float] The approximate location of the label.

**inline**

[bool, default: True] If *True* remove the segment of the contour beneath the label.

**inline\_spacing**

[int, default: 5] Space in pixels to leave on each side of label when placing inline. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

**transform**

[`Transform` or `False`, default: `self.axes.transData`] A transform applied to (*x*, *y*) before labeling. The default causes (*x*, *y*) to be interpreted as data coordinates. `False` is a synonym for `IdentityTransform`; i.e. (*x*, *y*) should be interpreted as display coordinates.

**calc\_label\_rot\_and\_inline** (*self*, *slc*, *ind*, *lw*, *lc=None*, *spacing=5*)

Calculate the appropriate label rotation given the linecontour coordinates in screen units, the index of the label location and the label width.

If *lc* is not None or empty, also break contours and compute inlining.

*spacing* is the empty space to leave around the label, in pixels.

Both tasks are done together to avoid calculating path lengths multiple times, which is relatively costly.

The method used here involves computing the path length along the contour in pixel coordinates and then looking approximately (label width / 2) away from central point to determine rotation and then to break contour if desired.

**clabel** (*self*, *levels=None*, \*, *fontsize=None*, *inline=True*, *inline\_spacing=5*, *fmt=None*, *colors=None*, *use\_clabelfont=False*, *manual=False*, *rightside\_up=True*, *zorder=None*)

Label a contour plot.

Adds labels to line contours in this `ContourSet` (which inherits from this mixin class).

## Parameters

**levels**

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `cs.levels`. If not given, all levels are labeled.

**fontsize**

[str or float, default: `rcParams["font.size"]` (default: 10.0)] Size in points or relative size e.g., 'smaller', 'x-large'. See `Text.set_size` for accepted string values.

**colors**

[color or colors or None, default: None] The label colors:

- If *None*, the color of each label matches the color of the corresponding contour.
- If one string color, e.g., `colors = 'r'` or `colors = 'red'`, all labels will be plotted in this color.
- If a tuple of colors (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.

**inline**

[bool, default: True] If `True` the underlying contour is removed where the label is placed.

**inline\_spacing**

[float, default: 5] Space in pixels to leave on each side of label when placing inline.

This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

**fmt**

[`Formatter` or str or callable or dict, optional] How the levels are formatted:

- If a `Formatter`, it is used to format all levels at once, using its `Formatter.format_ticks` method.
- If a str, it is interpreted as a %-style format string.
- If a callable, it is called with one level at a time and should return the corresponding label.
- If a dict, it should directly map levels to labels.

The default is to use a standard `ScalarFormatter`.

**manual**

[bool or iterable, default: False] If `True`, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter

to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

*manual* can also be an iterable object of (x, y) tuples. Contour labels will be created as if mouse is clicked at each (x, y) position.

### **rightside\_up**

[bool, default: True] If True, label rotations will always be plus or minus 90 degrees from level.

### **use\_clabeltext**

[bool, default: False] If True, *ClabelText* class (instead of *Text*) is used to create labels. *ClabelText* recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes.

### **zorder**

[float or None, default: (2 + contour.get\_zorder())] zorder of the contour labels.

## **Returns**

### **labels**

A list of *Text* instances for the labels.

### **get\_label\_coords (self, distances, XX, YY, ysize, lw)**

[Deprecated] Return x, y, and the index of a label location.

Labels are plotted at a location with the smallest deviation of the contour from a straight line unless there is another label nearby, in which case the next best place on the contour is picked up. If all such candidates are rejected, the beginning of the contour is chosen.

## **Notes**

Deprecated since version 3.4.

### **get\_label\_width (self, lev, fmt, fsize)**

Return the width of the label in points.

### **get\_text (self, lev, fmt)**

Get the text of the label.

### **labels (self, inline, inline\_spacing)**

### **locate\_label (self, linecontour, labelwidth)**

Find good place to draw a label (relatively flat part of the contour).

### **pop\_label (self, index=-1)**

Defaults to removing last label, but any index can be supplied

**print\_label**(*self, linecontour, linewidth*)

Return whether a contour is long enough to hold a label.

**set\_label\_props**(*self, label, text, color*)

Set the label properties - color, fontsize, text.

**too\_close**(*self, x, y, lw*)

Return whether a label is already near this location.

**class** matplotlib.contour.**ContourSet**(*ax, \*args, levels=None, filled=False, linewidths=None, linestyles=None, hatches=None, alpha=None, origin=None, extent=None, cmap=None, colors=None, norm=None, vmin=None, vmax=None, extend='neither', antialiased=None, nchunk=0, locator=None, transform=None, \*\*kwargs*)Bases: *matplotlib.cm.ScalarMappable, matplotlib.contour.ContourLabeler*

Store a set of contour lines or filled regions.

User-callable method: *clabel*

### Parameters

**ax**[*Axes*]**levels**

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

**allsegs**[[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

**allkinds**[None or [level0kinds, level1kinds, ...]] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not None, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not None, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

**\*\*kwargs**

Keyword arguments are as described in the docstring of `contour`.

**Attributes****ax**

[`Axes`] The Axes object in which the contours are drawn.

**collections**

[`silent_list` of `LineCollections` or `PathCollections`] The `Artists` representing the contour. This is a list of `LineCollections` for line contours and a list of `PathCollections` for filled contours.

**levels**

[array] The values of the contour levels.

**layers**

[array] Same as levels for line contours; half-way between levels for filled contours.  
See `ContourSet._process_colors`.

Draw contour lines or filled regions, depending on whether keyword arg `filled` is `False` (default) or `True`.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

**Parameters****ax**

[`Axes`] The `Axes` object to draw on.

**levels**

[`[level0, level1, ..., leveln]`] A list of floating point numbers indicating the contour levels.

**allsegs**

[`[level0segs, level1segs, ...]`] List of all the polygon segments for all the `levels`. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

**allkinds**

`[[level0kinds, level1kinds, ...], optional]` Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If `allkinds` is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

### \*\*kwargs

Keyword arguments are as described in the docstring of `contour`.

#### **property ax**

#### **changed(self)**

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

#### **find\_nearest\_contour(self, x, y, indices=None, pixel=True)**

Find the point in the contour plot that is closest to `(x, y)`.

#### Parameters

##### **x, y: float**

The reference point.

##### **indices**

[list of int or `None`, default: `None`] Indices of contour levels to consider. If `None` (the default), all levels are considered.

##### **pixel**

[bool, default: `True`] If `True`, measure distance in pixel (screen) space, which is useful for manual contour labeling; else, measure distance in axes space.

#### Returns

##### **contour**

[*Collection*] The contour that is closest to `(x, y)`.

##### **segment**

[int] The index of the `Path` in `contour` that is closest to `(x, y)`.

##### **index**

[int] The index of the path segment in `segment` that is closest to `(x, y)`.

**xmin, ymin**

[float] The point in the contour plot that is closest to (x, y).

**d2**

[float] The squared distance from (xmin, ymin) to (x, y).

**get\_alpha(self)**

Return alpha to be applied to all ContourSet artists.

**get\_transform(self)**

Return the *Transform* instance used by this ContourSet.

**legend\_elements(self, variable\_name='x', str\_format=<class 'str'>)**

Return a list of artists and labels suitable for passing through to *Legend* which represent this ContourSet.

The labels have the form "0 < x <= 1" stating the data ranges which the artists represent.

**Parameters****variable\_name**

[str] The string used inside the inequality used on the labels.

**str\_format**

[function: float -> str] Function used to format the numbers in the labels.

**Returns****artists**

[list[*Artist*]] A list of the artists.

**labels**

[list[str]] A list of the labels.

**set\_alpha(self, alpha)**

Set the alpha blending value for all ContourSet artists. *alpha* must be between 0 (transparent) and 1 (opaque).

```
class matplotlib.contour.QuadContourSet(ax, *args, levels=None, filled=False,
                                         linewidths=None, linestyles=None,
                                         hatches=None, alpha=None, origin=None,
                                         extent=None, cmap=None,
                                         colors=None, norm=None, vmin=None,
                                         vmax=None, extend='neither', antiAliased=None,
                                         nchunk=0, locator=None, transform=None, **kwargs)
```

Bases: *matplotlib.contour.ContourSet*

Create and store a set of contour lines or filled regions.

This class is typically not instantiated directly by the user but by `contour` and `contourf`.

### Attributes

#### ax

[`Axes`] The `Axes` object in which the contours are drawn.

#### collections

[`silent_list` of `LineCollections` or `PathCollections`] The `Artists` representing the contour. This is a list of `LineCollections` for line contours and a list of `PathCollections` for filled contours.

#### levels

[array] The values of the contour levels.

#### layers

[array] Same as levels for line contours; half-way between levels for filled contours.

See `ContourSet._process_colors`.

Draw contour lines or filled regions, depending on whether keyword arg `filled` is `False` (default) or `True`.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

### Parameters

#### ax

[`Axes`] The `Axes` object to draw on.

#### levels

[`[[level0, level1, ..., leveln]]`] A list of floating point numbers indicating the contour levels.

#### allsegs

[`[[level0segs, level1segs, ...]]`] List of all the polygon segments for all the `levels`. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

#### allkinds

[`[[level0kinds, level1kinds, ...], optional]`] Optional list of all the polygon vertex kinds (code types), as described and used in `Path`. This is used to allow

`multiply`-connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allseqs)`. The lists should look like

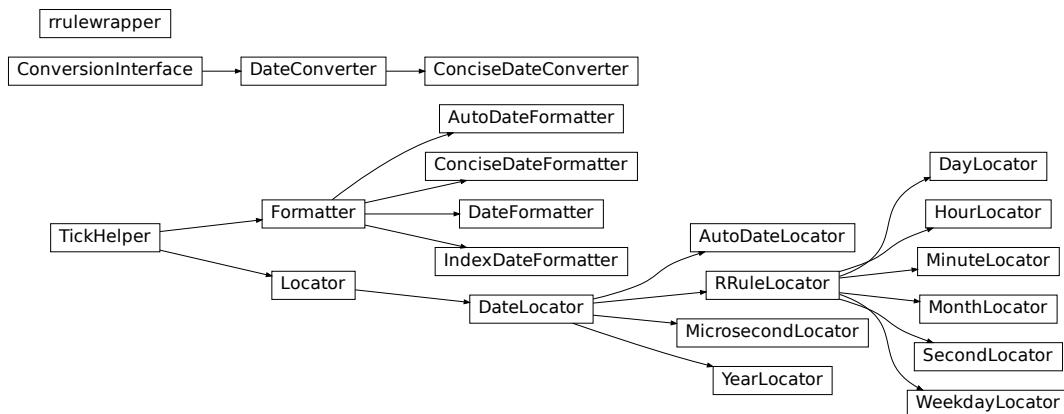

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If `allkinds` is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

## \*\*kwargs

Keyword arguments are as described in the docstring of `contour`.

## 18.21 matplotlib.dates

Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime` and the add-on module `dateutil`.

### 18.21.1 Matplotlib date format

Matplotlib represents dates using floating point numbers specifying the number of days since a default epoch of 1970-01-01 UTC; for example, 1970-01-01, 06:00 is the floating point number 0.25. The formatters and locators require the use of `datetime.datetime` objects, so only dates between year 0001 and 9999 can be represented. Microsecond precision is achievable for (approximately) 70 years on either side of the epoch, and 20 microseconds for the rest of the allowable range of dates (year 0001 to 9999). The epoch can be changed at import time via `dates.set_epoch` or `rcParams["dates.epoch"]` to other dates if necessary; see /gallery/ticks\_and\_spines/date\_precision\_and\_epochs for a discussion.

---

**Note:** Before Matplotlib 3.3, the epoch was 0000-12-31 which lost modern microsecond precision and also made the default axis limit of 0 an invalid datetime. In 3.3 the epoch was changed as above. To convert old ordinal floats to the new epoch, users can do:

```
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

---

There are a number of helper functions to convert between `datetime` objects and Matplotlib dates:

<code>datestr2num</code>	Convert a date string to a datenum using <code>dateutil.parser.parse</code> .
<code>date2num</code>	Convert datetime objects to Matplotlib dates.
<code>num2date</code>	Convert Matplotlib dates to <code>datetime</code> objects.
<code>num2timedelta</code>	Convert number of days to a <code>timedelta</code> object.
<code>drange</code>	Return a sequence of equally spaced Matplotlib dates.
<code>set_epoch</code>	Set the epoch (origin for dates) for datetime calculations.
<code>get_epoch</code>	Get the epoch used by <code>dates</code> .

---

---

**Note:** Like Python's `datetime.datetime`, Matplotlib uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and Matplotlib give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the `datetime` module we find:

```
In [1]: date(2006, 4, 1).toordinal() - date(1, 1, 1).toordinal()
Out[1]: 732401
```

---

All the Matplotlib date converters, tickers and formatters are timezone aware. If no explicit timezone is provided, `rcParams["timezone"]` (default: 'UTC') is assumed. If you want to use a custom time zone, pass a `datetime.tzinfo` instance with the `tz` keyword argument to `num2date`, `plot_date`, and any custom date tickers or locators you create.

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See `matplotlib.ticker` for general information on tick locators and formatters. These are described below.

The `dateutil` module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.

## 18.21.2 Date tickers

Most of the date tickers can locate single or multiple values. For example:

```
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on mondays and saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an interval argument:

```
# tick on mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The rrule locator allows completely general date ticking:

```
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRuleLocator(rule)
```

The available date tickers are:

- *MicrosecondLocator*: Locate microseconds.
- *SecondLocator*: Locate seconds.
- *MinuteLocator*: Locate minutes.
- *HourLocator*: Locate hours.
- *DayLocator*: Locate specified days of the month.
- *WeekdayLocator*: Locate days of the week, e.g., MO, TU.
- *MonthLocator*: Locate months, e.g., 7 for July.
- *YearLocator*: Locate years that are multiples of base.
- *RRuleLocator*: Locate using a `matplotlib.dates.rrulewrapper`. `rrulewrapper` is a simple wrapper around `dateutil.dateutil.rrule` which allow almost arbitrary date tick specifications. See rrule example.
- *AutoDateLocator*: On autoscale, this class picks the best *DateLocator* (e.g., *RRuleLocator*) to set the view limits and the tick locations. If called with `interval_multiples=True` it will make ticks line up with sensible multiples of the tick intervals. E.g. if the interval is 4 hours, it will pick hours 0, 4, 8, etc as ticks. This behaviour is not guaranteed by default.

### 18.21.3 Date formatters

The available date formatters are:

- *AutoDateFormatter*: attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.
- *ConciseDateFormatter*: also attempts to figure out the best format to use, and to make the format as compact as possible while still having complete date information. This is most useful when used with the *AutoDateLocator*.
- *DateFormatter*: use `strftime` format strings.
- *IndexDateFormatter*: date plots with implicit *x* indexing.

```
class matplotlib.dates.AutoDateFormatter(locator, tz=None, defaultfmt="%Y-%m-%d", *, usetex=None)
```

Bases: *matplotlib.ticker.Formatter*

A *Formatter* which attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.

The AutoDateFormatter has a scale dictionary that maps the scale of the tick (the distance in days between one major tick) and a format string. The default looks like this:

```
self.scaled = {
    DAYS_PER_YEAR: rcParams['date.autoformat.year'],
    DAYS_PER_MONTH: rcParams['date.autoformat.month'],
    1.0: rcParams['date.autoformat.day'],
    1. / HOURS_PER_DAY: rcParams['date.autoformat.hour'],
    1. / (MINUTES_PER_DAY): rcParams['date.autoformat.minute'],
    1. / (SEC_PER_DAY): rcParams['date.autoformat.second'],
    1. / (MSECONDS_PER_DAY): rcParams['date.autoformat.microsecond'],
}
```

The algorithm picks the key in the dictionary that is  $\geq$  the current scale and uses that format string. You can customize this dictionary by doing:

```
>>> locator = AutoDateLocator()
>>> formatter = AutoDateFormatter(locator)
>>> formatter.scaled[1/(24.*60.)] = '%M:%S' # only show min and sec
```

A custom *FuncFormatter* can also be used. The following example shows how to use a custom format function to strip trailing zeros from decimal seconds and adds the date to the first ticklabel:

```
>>> def my_format_function(x, pos=None):
...     x = matplotlib.dates.num2date(x)
...     if pos == 0:
...         fmt = '%D %H:%M:%S.%f'
...     else:
...         fmt = '%H:%M:%S.%f'
...     label = x.strftime(fmt)
...     label = label.rstrip("0")
...     label = label.rstrip(".")
```

(continues on next page)

(continued from previous page)

```

...     return label
>>> from matplotlib.ticker import FuncFormatter
>>> formatter.scaled[1 / (24.*60.)] = FuncFormatter(my_format_function)

```

Autoformat the date labels.

## Parameters

### locator

[*ticker.Locator*] Locator that this axis is using.

### tz

[str, optional] Passed to *dates.date2num*.

### defaultfmt

[str] The default format to use if none of the values in *self.scaled* are greater than the unit returned by *locator.\_get\_unit()*.

### usetex

[bool, default: *rcParams["text.usetex"]*] (default: False) To enable/disable the use of TeX's math mode for rendering the results of the formatter. If any entries in *self.scaled* are set as functions, then it is up to the customized function to enable or disable TeX's math mode itself.

**class** *matplotlib.dates.AutoDateLocator* (*tz=None*, *minticks=5*, *maxticks=None*, *interval\_multiples=True*)

Bases: *matplotlib.dates.DateLocator*

On autoscale, this class picks the best *DateLocator* to set the view limits and the tick locations.

## Attributes

### interval

[dict] Mapping of tick frequencies to multiples allowed for that ticking. The default is

```

self.interval = {
    YEARLY : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400,
              ↴500,
              1000, 2000, 4000, 5000, 10000],
    MONTHLY : [1, 2, 3, 4, 6],
    DAILY : [1, 2, 3, 7, 14, 21],
    HOURLY : [1, 2, 3, 4, 6, 12],
    MINUTELY: [1, 5, 10, 15, 30],
    SECONDLY: [1, 5, 10, 15, 30],
    MICROSECONDLY: [1, 2, 5, 10, 20, 50, 100, 200, 500,
                    1000, 2000, 5000, 10000, 20000, 50000,
                    100000, 200000, 500000, 1000000],
}

```

where the keys are defined in `dateutil.rrule`.

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense.

When customizing, you should only modify the values for the existing keys. You should not add or delete entries.

Example for forcing ticks every 3 hours:

```
locator = AutoDateLocator()  
locator.interval[HOURLY] = [3] # only show every 3 hours
```

## Parameters

### **tz**

[`datetime.tzinfo`] Ticks timezone.

### **minticks**

[int] The minimum number of ticks desired; controls whether ticks occur yearly, monthly, etc.

### **maxticks**

[int] The maximum number of ticks desired; controls the interval between ticks (ticking every other, every 3, etc.). For fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks appropriate to the format chosen in `AutoDateFormatter`. Any frequency not specified in this dictionary is given a default value.

### **interval\_multiples**

[bool, default: True] Whether ticks should be chosen to be multiple of the interval, locking them to 'nicer' locations. For example, this will force the ticks to be at hours 0, 6, 12, 18 when hourly ticking is done at 6 hour intervals.

### **get\_locator (self, dmin, dmax)**

Pick the best locator based on a distance.

### **nonsingular (self, vmin, vmax)**

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

### **tick\_values (self, vmin, vmax)**

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the **vmin** and **vmax** values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

```
class matplotlib.dates.ConciseDateConverter(formats=None,
zero_formats=None,
offset_formats=None,
show_offset=True, *, interval_multiples=True)
```

Bases: *matplotlib.dates.DateConverter*

**axisinfo** (*self, unit, axis*)

Return the *AxisInfo* for *unit*.

*unit* is a tzinfo instance or None. The *axis* argument is required but not used.

```
class matplotlib.dates.ConciseDateFormatter(locator, tz=None, formats=None, offset_formats=None,
zero_formats=None, show_offset=True, *, usetex=None)
```

Bases: *matplotlib.ticker.Formatter*

A *Formatter* which attempts to figure out the best format to use for the date, and to make it as compact as possible, but still be complete. This is most useful when used with the *AutoDateLocator*:

```
>>> locator = AutoDateLocator()
>>> formatter = ConciseDateFormatter(locator)
```

## Parameters

### locator

[*ticker.Locator*] Locator that this axis is using.

### tz

[str, optional] Passed to *dates.date2num*.

### formats

[list of 6 strings, optional] Format strings for 6 levels of tick labelling: mostly years, months, days, hours, minutes, and seconds. Strings use the same format codes as *strftime*. Default is ['%Y', '%b', '%d', '%H:%M', '%H:%M', '%S.%f']

### zero\_formats

[list of 6 strings, optional] Format strings for tick labels that are "zeros" for a given tick level. For instance, if most ticks are months, ticks around 1 Jan 2005 will be

labeled "Dec", "2005", "Feb". The default is [ ' ', '%Y', '%b', '%b-%d', '%H:%M', '%H:%M' ]

#### **offset\_formats**

[list of 6 strings, optional] Format strings for the 6 levels that is applied to the "offset" string found on the right side of an x-axis, or top of a y-axis. Combined with the tick labels this should completely specify the date. The default is:

```
[ ' ', '%Y', '%Y-%b', '%Y-%b-%d', '%Y-%b-%d', '%Y-%b-%d %H:%M  
  ↳ ' ]
```

#### **show\_offset**

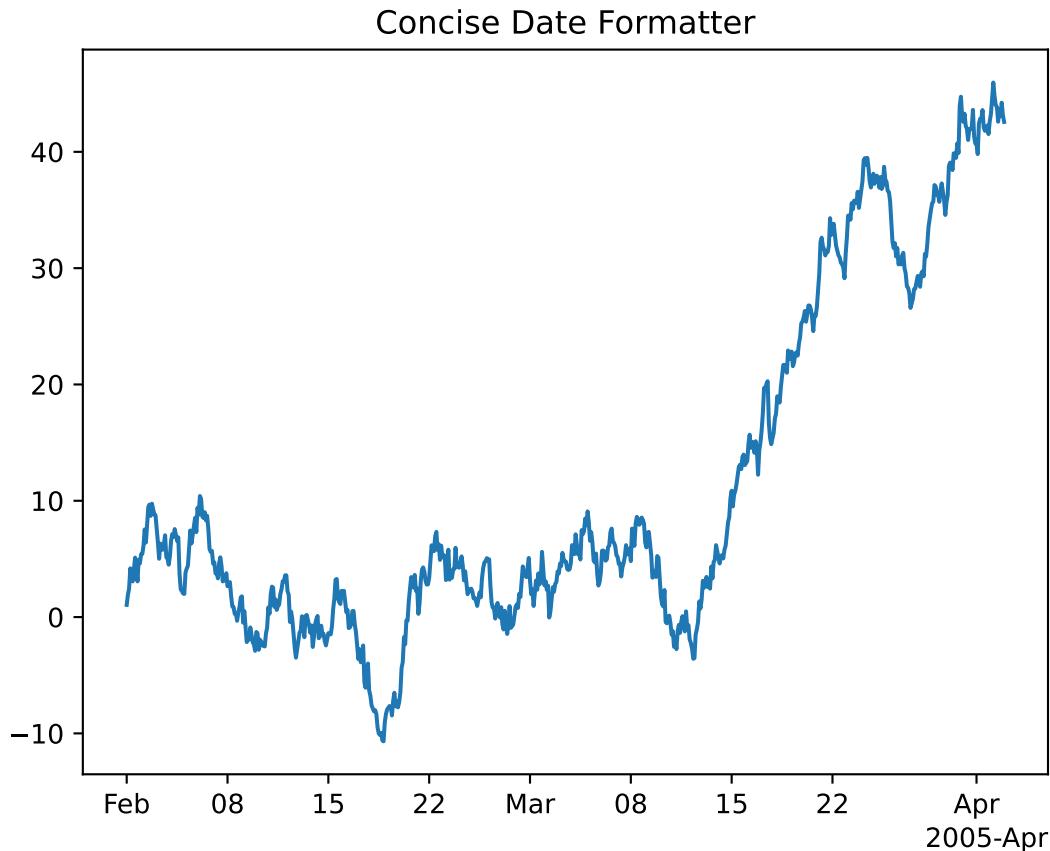

[bool, default: True] Whether to show the offset or not.

#### **usetex**

[bool, default: `rcParams["text.usetex"]` (default: False)] To enable/disable the use of TeX's math mode for rendering the results of the formatter.

## **Examples**

See /gallery/ticks\_and\_spines/date\_concise\_formatter

Autoformat the date labels. The default format is used to form an initial string, and then redundant elements are removed.

**format\_data\_short** (*self, value*)

Return a short string version of the tick value.

Defaults to the position-independent long value.

**format\_ticks** (*self, values*)

Return the tick labels for all the ticks at once.

**get\_offset** (*self*)

**class** matplotlib.dates.DateConverter (\*, interval\_multiples=True)

Bases: *matplotlib.units.ConversionInterface*

Converter for `datetime.date` and `datetime.datetime` data, or for date/time data represented as it would be converted by `date2num`.

The 'unit' tag for such data is None or a tzinfo instance.

**axisinfo** (*self, unit, axis*)

Return the *AxisInfo* for *unit*.

*unit* is a tzinfo instance or None. The *axis* argument is required but not used.

**static convert** (*value, unit, axis*)

If *value* is not already a number or sequence of numbers, convert it with `date2num`.

The *unit* and *axis* arguments are not used.

**static default\_units** (*x, axis*)

Return the tzinfo instance of *x* or of its first element, or None

**class** matplotlib.dates.DateFormatter (*fmt, tz=None, \*, usetex=None*)

Bases: *matplotlib.ticker.Formatter*

Format a tick (in days since the epoch) with a `strftime` format string.

### Parameters

**fmt**

[str] `strftime` format string

**tz**

[`datetime.tzinfo`, default: `rcParams["timezone"]`] (default: 'UTC') Ticks timezone.

**usetex**

[bool, default: `rcParams["text.usetex"]`] (default: False) To enable/disable the use of TeX's math mode for rendering the results of the formatter.

**property illegal\_s**

**set\_tzinfo** (*self, tz*)

```
class matplotlib.dates.DateLocator(tz=None)
Bases: matplotlib.ticker.Locator
```

Determines the tick locations when plotting dates.

This class is subclassed by other Locators and is not meant to be used on its own.

### Parameters

**tz**

[`datetime.tzinfo`]

**dataLim\_to\_dt(self)**

Convert axis data interval to datetime objects.

**hms0d = {'byhour': 0, 'byminute': 0, 'bysecond': 0}**

**nonsingular(self, vmin, vmax)**

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

**set\_tzinfo(self, tz)**

Set time zone info.

**viewLim\_to\_dt(self)**

Convert the view interval to datetime objects.

```
class matplotlib.dates.DayLocator(bymonthday=None, interval=1, tz=None)
```

Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurrences of each day of the month. For example, 1, 15, 30.

Mark every day in `bymonthday`; `bymonthday` can be an int or sequence.

Default is to tick every day of the month: `bymonthday=range(1, 32)`.

```
class matplotlib.dates.HourLocator(byhour=None, interval=1, tz=None)
```

Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurrences of each hour.

Mark every hour in `byhour`; `byhour` can be an int or sequence. Default is to tick every hour: `byhour=range(24)`

`interval` is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

```
class matplotlib.dates.IndexDateFormatter(**kwargs)
```

Bases: `matplotlib.ticker.Formatter`

[*Deprecated*] Use with `IndexLocator` to cycle format strings by index.

## Notes

Deprecated since version 3.3.

### Parameters

**t**

[list of float] A sequence of dates (floating point days).

**fmt**

[str] A `strftime` format string.

**class** `matplotlib.dates.MicrosecondLocator` (*interval=1, tz=None*)

Bases: `matplotlib.dates.DateLocator`

Make ticks on regular intervals of one or more microsecond(s).

**Note:** By default, Matplotlib uses a floating point representation of time in days since the epoch, so plotting data with microsecond time resolution does not work well for dates that are far (about 70 years) from the epoch (check with `get_epoch`).

If you want sub-microsecond resolution time plots, it is strongly recommended to use floating point seconds, not datetime-like time representation.

If you really must use `datetime.datetime()` or similar and still need microsecond precision, change the time origin via `dates.set_epoch` to something closer to the dates being plotted. See /gallery/ticks\_and\_spines/date\_precision\_and\_epochs.

*interval* is the interval between each iteration. For example, if `interval=2`, mark every second microsecond.

`set_axis(self, axis)`

`set_data_interval(self, vmin, vmax)`

`set_view_interval(self, vmin, vmax)`

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```
class matplotlib.dates.MinuteLocator(byminute=None, interval=1, tz=None)
Bases: matplotlib.dates.RRuleLocator
```

Make ticks on occurrences of each minute.

Mark every minute in *byminute*; *byminute* can be an int or sequence. Default is to tick every minute: *byminute*=range(60)

*interval* is the interval between each iteration. For example, if *interval*=2, mark every second occurrence.

```
class matplotlib.dates.MonthLocator(bymonth=None, bymonthday=1, interval=1,
tz=None)
Bases: matplotlib.dates.RRuleLocator
```

Make ticks on occurrences of each month, e.g., 1, 3, 12.

Mark every month in *bymonth*; *bymonth* can be an int or sequence. Default is range(1, 13), i.e. every month.

*interval* is the interval between each iteration. For example, if *interval*=2, mark every second occurrence.

```
class matplotlib.dates.RRuleLocator(o, tz=None)
Bases: matplotlib.dates.DateLocator
```

### Parameters

**tz**

[datetime.tzinfo]

**static get\_unit\_generic(freq)**

**tick\_values(self, vmin, vmax)**

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the **vmin** and **vmax** values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

```
class matplotlib.dates.SecondLocator(bysecond=None, interval=1, tz=None)
Bases: matplotlib.dates.RRuleLocator
```

Make ticks on occurrences of each second.

Mark every second in *bysecond*; *bysecond* can be an int or sequence. Default is to tick every second: *bysecond* = range(60)

*interval* is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

**class** `matplotlib.dates.WeekdayLocator` (*byweekday=I, interval=1, tz=None*)  
 Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurrences of each weekday.

Mark every weekday in *byweekday*; *byweekday* can be a number or sequence.

Elements of *byweekday* must be one of MO, TU, WE, TH, FR, SA, SU, the constants from `dateutil.rrule`, which have been imported into the `matplotlib.dates` namespace.

*interval* specifies the number of weeks to skip. For example, `interval=2` plots every second week.

**class** `matplotlib.dates.YearLocator` (*base=1, month=1, day=1, tz=None*)  
 Bases: `matplotlib.dates.DateLocator`

Make ticks on a given day of each year that is a multiple of base.

Examples:

```
# Tick every year on Jan 1st
locator = YearLocator()

# Tick every 5 years on July 4th
locator = YearLocator(5, month=7, day=4)
```

Mark years that are multiple of base on a given month and day (default jan 1).

**tick\_values** (*self, vmin, vmax*)  
 Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`matplotlib.dates.date2num(d)`  
 Convert datetime objects to Matplotlib dates.

### Parameters

**d**

[`datetime.datetime` or `numpy.datetime64` or sequences of these]

### Returns

**float or sequence of floats**

Number of days since the epoch. See `get_epoch` for the epoch, which can be changed by `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') or `set_epoch`. If the epoch is "1970-01-01T00:00:00" (default) then noon Jan 1 1970 ("1970-01-01T12:00:00") returns 0.5.

### Notes

The Gregorian calendar is assumed; this is not universal practice. For details see the module docstring.

`matplotlib.dates.datestr2num(d, default=None)`

Convert a date string to a datenum using `dateutil.parser.parse`.

#### Parameters

**d**

[str or sequence of str] The dates to convert.

**default**

[`datetime.datetime`, optional] The default date to use when fields are missing in *d*.

`matplotlib.dates.drange(dstart, dend, delta)`

Return a sequence of equally spaced Matplotlib dates.

The dates start at *dstart* and reach up to, but not including *dend*. They are spaced by *delta*.

#### Parameters

**dstart, dend**

[`datetime`] The date limits.

**delta**

[`datetime.timedelta`] Spacing of the dates.

#### Returns

`numpy.array`

A list floats representing Matplotlib dates.

`matplotlib.dates.epoch2num(e)`

Convert UNIX time to days since Matplotlib epoch.

#### Parameters

**e**

[list of floats] Time in seconds since 1970-01-01.

#### Returns

**numpy.array**

Time in days since Matplotlib epoch (see `get_epoch()`).

**matplotlib.dates.get\_epoch()**

Get the epoch used by `dates`.

**Returns****epoch**

[str] String for the epoch (parsable by `numpy.datetime64`).

**matplotlib.dates.num2date(x, tz=None)**

Convert Matplotlib dates to `datetime` objects.

**Parameters****x**

[float or sequence of floats] Number of days (fraction part represents hours, minutes, seconds) since the epoch. See `get_epoch` for the epoch, which can be changed by `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') or `set_epoch`.

**tz**

[str, default: `rcParams["timezone"]`] (default: 'UTC') Timezone of *x*.

**Returns****datetime or sequence of datetime**

Dates are returned in timezone *tz*.

If *x* is a sequence, a sequence of `datetime` objects will be returned.

**Notes**

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

**matplotlib.dates.num2epoch(d)**

Convert days since Matplotlib epoch to UNIX time.

**Parameters****d**

[list of floats] Time in days since Matplotlib epoch (see `get_epoch()`).

**Returns**

### `numpy.array`

Time in seconds since 1970-01-01.

`matplotlib.dates.num2timedelta(x)`

Convert number of days to a `timedelta` object.

If `x` is a sequence, a sequence of `timedelta` objects will be returned.

#### Parameters

`x`

[float, sequence of floats] Number of days. The fraction part represents hours, minutes, seconds.

#### Returns

`datetime.timedelta or list[datetime.timedelta]`

`class matplotlib.dates.relativedelta(dt1=None, dt2=None, years=0, months=0, days=0, leapdays=0, weeks=0, hours=0, minutes=0, seconds=0, microseconds=0, year=None, month=None, day=None, weekday=None, yearday=None, nlyearday=None, hour=None, minute=None, second=None, microsecond=None)`

Bases: `object`

The `relativedelta` type is designed to be applied to an existing `datetime` and can replace specific components of that `datetime`, or represents an interval of time.

It is based on the specification of the excellent work done by M.-A. Lemburg in his `mx.DateTime` extension. However, notice that this type does *NOT* implement the same algorithm as his work. Do *NOT* expect it to behave like `mx.DateTime`'s counterpart.

There are two different ways to build a `relativedelta` instance. The first one is passing it two date/`datetime` classes:

```
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```
relativedelta(arg1=x, arg2=y, arg3=z...)  
  
year, month, day, hour, minute, second, microsecond:  
    Absolute information (argument is singular); adding or subtracting a  
    relativedelta with absolute information does not perform an  
    arithmetic  
    operation, but rather REPLACES the corresponding value in the  
    original datetime with the value(s) in relativedelta.
```

(continues on next page)

(continued from previous page)

```

years, months, weeks, days, hours, minutes, seconds, microseconds:
    Relative information, may be negative (argument is plural); adding
    or subtracting a relativedelta with relative information performs
    the corresponding arithmetic operation on the original datetime value
    with the information in the relativedelta.

weekday:
    One of the weekday instances (MO, TU, etc) available in the
    relativedelta module. These instances may receive a parameter N,
    specifying the Nth weekday, which could be positive or negative
    (like MO(+1) or MO(-2)). Not specifying it is the same as specifying
    +1. You can also use an integer, where 0=MO. This argument is always
    relative e.g. if the calculated date is already Monday, using MO(1)
    or MO(-1) won't change the day. To effectively make it absolute, use
    it in combination with the day argument (e.g. day=1, MO(1) for first
    Monday of the month).

leapdays:
    Will add given days to the date found, if year is a leap
    year, and the date found is post 28 of february.

yearday, nlyearday:
    Set the yearday or the non-leap year day (jump leap days).
    These are converted to day/month/leapdays information.

```

There are relative and absolute forms of the keyword arguments. The plural is relative, and the singular is absolute. For each argument in the order below, the absolute form is applied first (by setting each attribute to that value) and then the relative form (by adding the value to the attribute).

The order of attributes considered when this relativedelta is added to a datetime is:

1. Year
2. Month
3. Day
4. Hours
5. Minutes
6. Seconds
7. Microseconds

Finally, weekday is applied, using the rule described above.

For example

```

>>> from datetime import datetime
>>> from dateutil.relativedelta import relativedelta, MO
>>> dt = datetime(2018, 4, 9, 13, 37, 0)
>>> delta = relativedelta(hours=25, day=1, weekday=MO(1))
>>> dt + delta
datetime.datetime(2018, 4, 2, 14, 37)

```

First, the day is set to 1 (the first of the month), then 25 hours are added, to get to the 2nd day and 14th hour, finally the weekday is applied, but since the 2nd is already a Monday there is no effect.

### `normalized(self)`

Return a version of this object represented entirely using integer values for the relative attributes.

```
>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=+1, hours=+14)
```

### Returns

Returns a `dateutil.relativedelta.relativedelta` object.

### `property weeks`

```
class matplotlib.dates.rrule(freq, dtstart=None, interval=1, wkst=None, count=None,
                             until=None, bysetpos=None, bymonth=None, bymonthday=None,
                             byyearday=None, byeaster=None, byweekno=None,
                             byweekday=None, byhour=None, byminute=None,
                             bysecond=None, cache=False)
```

Bases: `dateutil.rrule.rrulebase`

That's the base of the `rrule` operation. It accepts all the keywords defined in the RFC as its constructor parameters (except `byday`, which was renamed to `byweekday`) and more. The constructor prototype is:

```
rrule(freq)
```

Where `freq` must be one of `YEARLY`, `MONTHLY`, `WEEKLY`, `DAILY`, `HOURLY`, `MINUTELY`, or `SECONDLY`.

---

**Note:** Per RFC section 3.3.10, recurrence instances falling on invalid dates and times are ignored rather than coerced:

Recurrence rules may generate recurrence instances with an invalid date (e.g., February 30) or nonexistent local time (e.g., 1:30 AM on a day where the local time is moved forward by an hour at 1:00 AM). Such recurrence instances MUST be ignored and MUST NOT be counted as part of the recurrence set.

This can lead to possibly surprising behavior when, for example, the start date occurs at the end of the month:

```
>>> from dateutil.rrule import rrule, MONTHLY
>>> from datetime import datetime
>>> start_date = datetime(2014, 12, 31)
>>> list(rrule(freq=MONTHLY, count=4, dtstart=start_date))
...
[datetime.datetime(2014, 12, 31, 0, 0),
 datetime.datetime(2015, 1, 31, 0, 0),
 datetime.datetime(2015, 3, 31, 0, 0),
 datetime.datetime(2015, 5, 31, 0, 0)]
```

Additionally, it supports the following keyword arguments:

## Parameters

- **dtstart** -- The recurrence start. Besides being the base for the recurrence, missing parameters in the final recurrence instances will also be extracted from this date. If not given, `datetime.now()` will be used instead.
- **interval** -- The interval between each freq iteration. For example, when using `YEARLY`, an interval of 2 means once every two years, but with `HOURLY`, it means once every two hours. The default interval is 1.
- **wkst** -- The week start day. Must be one of the `MO`, `TU`, `WE` constants, or an integer, specifying the first day of the week. This will affect recurrences based on weekly periods. The default week start is got from `calendar.firstweekday()`, and may be modified by `calendar.setfirstweekday()`.
- **count** -- If given, this determines how many occurrences will be generated.

---

**Note:** As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with [RFC-5545 Sec. 3.3.10](#). Therefore, `until` and `count` **must not** occur in the same call to `rrule`.

---

- **until** -- If given, this must be a `datetime` instance specifying the upper-bound limit of the recurrence. The last recurrence in the rule is the greatest `datetime` that is less than or equal to the value specified in the `until` parameter.

---

**Note:** As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with [RFC-5545 Sec. 3.3.10](#). Therefore, `until` and `count` **must not** occur in the same call to `rrule`.

---

- **bysetpos** -- If given, it must be either an integer, or a sequence of integers, positive or negative. Each given integer will specify an occurrence number, corresponding to the nth occurrence of the rule inside the frequency period. For example, a `bysetpos` of -1 if combined with a `MONTHLY` frequency, and a `byweekday` of (`MO`, `TU`, `WE`, `TH`, `FR`), will result in the last work day of every month.
- **bymonth** -- If given, it must be either an integer, or a sequence of integers, meaning the months to apply the recurrence to.
- **bymonthday** -- If given, it must be either an integer, or a sequence of integers, meaning the month days to apply the recurrence to.
- **byyearday** -- If given, it must be either an integer, or a sequence of integers, meaning the year days to apply the recurrence to.
- **byeaster** -- If given, it must be either an integer, or a sequence of integers, positive or negative. Each integer will define an offset from the Easter Sunday.

Passing the offset 0 to `byeaster` will yield the Easter Sunday itself. This is an extension to the RFC specification.

- **byweekno** -- If given, it must be either an integer, or a sequence of integers, meaning the week numbers to apply the recurrence to. Week numbers have the meaning described in ISO8601, that is, the first week of the year is that containing at least four days of the new year.
- **byweekday** -- If given, it must be either an integer (0 == MO), a sequence of integers, one of the weekday constants (MO, TU, etc), or a sequence of these constants. When given, these variables will define the weekdays where the recurrence will be applied. It's also possible to use an argument n for the weekday instances, which will mean the nth occurrence of this weekday in the period. For example, with MONTHLY, or with YEARLY and BYMONTH, using FR(+1) in byweekday will specify the first friday of the month where the recurrence happens. Notice that in the RFC documentation, this is specified as BYDAY, but was renamed to avoid the ambiguity of that keyword.
- **byhour** -- If given, it must be either an integer, or a sequence of integers, meaning the hours to apply the recurrence to.
- **byminute** -- If given, it must be either an integer, or a sequence of integers, meaning the minutes to apply the recurrence to.
- **bysecond** -- If given, it must be either an integer, or a sequence of integers, meaning the seconds to apply the recurrence to.
- **cache** -- If given, it must be a boolean value specifying to enable or disable caching of results. If you will use the same rrule instance multiple times, enabling caching will improve the performance considerably.

**`replace(self, **kwargs)`**

Return new rrule with same attributes except for those attributes given new values by whichever keyword arguments are specified.

**`matplotlib.dates.set_epoch(epoch)`**

Set the epoch (origin for dates) for datetime calculations.

The default epoch is `rcParams["dates.epoch"]` (by default 1970-01-01T00:00).

If microsecond accuracy is desired, the date being plotted needs to be within approximately 70 years of the epoch. Matplotlib internally represents dates as days since the epoch, so floating point dynamic range needs to be within a factor of 2^52.

`set_epoch` must be called before any dates are converted (i.e. near the import section) or a RuntimeError will be raised.

See also /gallery/ticks\_and\_spines/date\_precision\_and\_epochs.

**Parameters****epoch**

[str] valid UTC date parsable by `numpy.datetime64` (do not include time-zone).

## 18.22 matplotlib.docstring

```
class matplotlib.docstring.Substitution(*args, **kwargs)
Bases: object
```

A decorator that performs %-substitution on an object's docstring.

This decorator should be robust even if `obj.__doc__` is None (for example, if -OO was passed to the interpreter).

Usage: construct a `docstring.Substitution` with a sequence or dictionary suitable for performing substitution; then decorate a suitable function with the constructed object, e.g.:

```
sub_author_name = Substitution(author='Jason')

@sub_author_name
def some_function(x):
    "%(author)s wrote this function"

# note that some_function.__doc__ is now "Jason wrote this function"
```

One can also use positional arguments:

```
sub_first_last_names = Substitution('Edgar Allen', 'Poe')

@sub_first_last_names
def some_function(x):
    "%s %s wrote the Raven"
```

`update(self, *args, **kwargs)`

Update `self.params` (which must be a dict) with the supplied args.

`matplotlib.docstring.copy(source)`

Copy a docstring from another source function (if present).

## 18.23 matplotlib.dviread

A module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

Interface:

```
with Dvi(filename, 72) as dvi:
    # iterate over pages:
    for page in dvi:
        w, h, d = page.width, page.height, page.descent
```

(continues on next page)

(continued from previous page)

```
for x, y, font, glyph, width in page.text:
    fontname = font.texname
    pointsize = font.size
    ...
for x, y, height, width in page.boxes:
    ...
    ...
```

**class** `matplotlib.dviread.Dvi` (*filename, dpi*)

Bases: `object`

A reader for a dvi ("device-independent") file, as produced by TeX. The current implementation can only iterate through pages in order, and does not even attempt to verify the postamble.

This class can be used as a context manager to close the underlying file upon exit. Pages can be read via iteration. Here is an overly simple way to extract text without trying to detect whitespace:

```
>>> with matplotlib.dviread.Dvi('input.dvi', 72) as dvi:
...     for page in dvi:
...         print(''.join(t.glyph) for t in page.text))
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use None to return TeX's internal units.

**close** (*self*)

Close the underlying file if it is open.

**class** `matplotlib.dviread.DviFont` (*scale, tfm, texname, vf*)

Bases: `object`

Encapsulation of a font that a DVI file can refer to.

This class holds a font's texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by dviread.py) that are *not* used for comparison.

The size is in Adobe points (converted from TeX points).

### Parameters

**scale**

[float] Factor by which the font is scaled from its natural size.

**tfm**

[Tfm] TeX font metrics for this font

**texname**

[bytes] Name of the font as used internally by TeX and friends, as an ASCII bytestring. This is usually very different from any external font names; `Psf-  
fontsMap` can be used to find the external name of the font.

**vf**

[Vf] A TeX "virtual font" file, or None if this font is not virtual.

### Attributes

#### **texname**

[bytes]

#### **size**

[float] Size of the font in Adobe points, converted from the slightly smaller TeX points.

#### **widths**

[list] Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

#### **size**

#### **texname**

#### **widths**

**class** matplotlib.dviread.Encoding(\*\*kwargs)

Bases: object

*[Deprecated]* Parse a \*.enc file referenced from a psfonts.map style file.

The format this class understands is a very limited subset of PostScript.

Usage (subject to change):

```
for name in Encoding(filename):
    whatever(name)
```

### Parameters

#### **filename**

[str or path-like]

### Notes

Deprecated since version 3.3.

### Attributes

#### **encoding**

[list] List of character names

#### **encoding**

```
class matplotlib.dviread.PsFont (texname, psname, effects, encoding, filename)
```

Bases: `tuple`

Create new instance of PsFont(texname, psname, effects, encoding, filename)

**effects**

Alias for field number 2

**encoding**

Alias for field number 3

**filename**

Alias for field number 4

**psname**

Alias for field number 1

**texname**

Alias for field number 0

```
class matplotlib.dviread.PsfntsMap (filename)
```

Bases: `object`

A psfonts.map formatted file, mapping TeX fonts to PS fonts.

**Parameters**

**filename**

[str or path-like]

### Notes

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX's native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. `psfonts.map`, `pdftex.map`, or `dvipdfm.map`. The file `psfonts.map` is used by `dvips`, `pdftex.map` by `pdfTeX`, and `dvipdfm.map` by `dvipdfm`. `psfonts.map` might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the "Base 14" pdf fonts. But the user may have configured these files differently.

## Examples

```
>>> map = PsfontsMap(find_tex_file('pdftex.map'))
>>> entry = map[b'ptmbo8r']
>>> entry.texname
b'ptmbo8r'
>>> entry.psname
b'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.1670000000000001}
>>> entry.filename
```

**class** matplotlib.dviread.**Tfm** (*filename*)

Bases: `object`

A TeX Font Metric file.

This implementation covers only the bare minimum needed by the Dvi class.

### Parameters

#### **filename**

[str or path-like]

### Attributes

#### **checksum**

[int] Used for verifying against the dvi file.

#### **design\_size**

[int] Design size of the font (unknown units)

#### **width, height, depth**

[dict] Dimensions of each character, need to be scaled by the factor specified in the dvi file. These are dicts because indexing may not start from 0.

#### **checksum**

#### **depth**

#### **design\_size**

#### **height**

#### **width**

**class** matplotlib.dviread.**Vf** (*filename*)

Bases: `matplotlib.dviread.Dvi`

A virtual font (\*.vf file) containing subroutines for dvi files.

## Parameters

### filename

[str or path-like]

## Notes

The virtual font format is a derivative of dvi: <http://mirrors.ctan.org/info/knuth/virtual-fonts> This class reuses some of the machinery of [Dvi](#) but replaces the `_read` loop and dispatch mechanism.

## Examples

```
vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.boxes, glyph.width
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use `None` to return TeX's internal units.

`matplotlib.dviread.find_tex_file(filename, format=None)`

Find a file in the texmf tree.

Calls **kpsewhich** which is an interface to the kpathsea library [1]. Most existing TeX distributions on Unix-like systems use kpathsea. It is also available as part of MikTeX, a popular distribution on Windows.

*If the file is not found, an empty string is returned.*

## Parameters

### filename

[str or path-like]

### format

[str or bytes] Used as the value of the `--format` option to **kpsewhich**. Could be e.g. 'tfm' or 'vf' to limit the search to that type of files.

## References

[1]

## 18.24 matplotlib.figure

`matplotlib.figure` implements the following classes:

### Figure

Top level `Artist`, which holds all plot elements. Many methods are implemented in `FigureBase`.

### SubFigure

A logical figure inside a figure, usually added to a figure (or parent `SubFigure`) with `Figure.add_subfigure` or `Figure.subfigures` methods (provisional API v3.4).

### SubplotParams

Control the default spacing between subplots.

```
class matplotlib.figure.Figure(figsize=None, dpi=None, facecolor=None, edgecolor=None, linewidth=0.0, frameon=None, subplotpars=None, tight_layout=None, constrained_layout=None)
```

The top level container for all the plot elements.

The Figure instance supports callbacks through a `callbacks` attribute which is a `CallbackRegistry` instance. The events you can connect to are 'dpi\_changed', and the callback will be called with `func(fig)` where `fig` is the `Figure` instance.

### Attributes

#### patch

The `Rectangle` instance representing the figure background patch.

#### suppressComposite

For multiple figure images, the figure will make composite images depending on the renderer option `_image_nocomposite` function. If `suppressComposite` is a boolean, this will override the renderer.

### Parameters

#### figsize

[2-tuple of floats, default: `rcParams["figure.figsize"]` (default: [6.4, 4.8])] Figure dimension (width, height) in inches.

#### dpi

[float, default: `rcParams["figure.dpi"]` (default: 100.0)] Dots per inch.

#### facecolor

[default: `rcParams["figure.facecolor"]` (default: 'white')] The figure patch facecolor.

**edgecolor**

[default: `rcParams["figure.edgecolor"]` (default: 'white')] The figure patch edge color.

**linewidth**

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

**frameon**

[bool, default: `rcParams["figure.frameon"]` (default: True)] If False, suppress drawing the figure background patch.

**subplotpars**

[*SubplotParams*] Subplot parameters. If not given, the default subplot parameters `rcParams["figure.subplot.*"]` are used.

**tight\_layout**

[bool or dict, default: `rcParams["figure.autolayout"]` (default: False)] If False use `subplotpars`. If True adjust subplot parameters using `tight_layout` with default padding. When providing a dict containing the keys pad, w\_pad, h\_pad, and rect, the default `tight_layout` paddings will be overridden.

**constrained\_layout**

[bool, default: `rcParams["figure.constrained_layout.use"]` (default: False)] If True use constrained layout to adjust positioning of plot elements. Like `tight_layout`, but designed to be more flexible. See [Constrained Layout Guide](#) for examples. (Note: does not work with `add_subplot` or `subplots2grid`.)

**add\_artist**(*self, artist, clip=False*)

Add an [Artist](#) to the figure.

Usually artists are added to Axes objects using `Axes.add_artist`; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

**Parameters****artist**

[[Artist](#)] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transSubfigure`.

**clip**

[bool, default: False] Whether the added artist should be clipped by the figure patch.

**Returns**

***Artist***

The added artist.

---

**`add_axes(self, *args, **kwargs)`**

新版本已经用`add_subplot` 代替

Add an Axes to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

**Parameters****rect**

[sequence of float] The dimensions [left, bottom, width, height] of the new Axes.  
All quantities are in fractions of figure width and height.

**projection**

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the `Axes`. *str* is the name of a custom projection, see `projections`. The default None results in a 'rectilinear' projection.

**polar**

[bool, default: False] If True, equivalent to `projection='polar'`.

**axes\_class**

[subclass type of `Axes`, optional] The `axes.Axes` subclass that is instantiated. This parameter is incompatible with `projection` and `polar`. See `axisartist` for examples.

**sharex, sharey**

[`Axes`, optional] Share the x or y `axis` with `sharex` and/or `sharey`. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label**

[str] A label for the returned Axes.

**Returns****`Axes`, or a subclass of `Axes`**

The returned axes class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used.

**Other Parameters**

**\*\*kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

**Figure属性**

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float

<code>zorder</code>	float

See also:

`Figure.add_subplot`  
`pyplot.subplot`  
`pyplot.axes`  
`Figure.subplots`  
`pyplot.subplots`

## Notes

In rare circumstances, `add_axes` may be called with a single argument, an Axes instance already created in the present figure but not in the figure's list of Axes.

## Examples

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

### `add_axobserver(self, func)`

Whenever the Axes state change, `func(self)` will be called.

**add\_callback**(*self, func*)

Add a callback function that will be called whenever one of the [Artist](#)'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling [Artist](#). Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with [remove\\_callback](#) later.

**See also:**

[remove\\_callback](#)

**add\_gridspec**(*self, nrows=1, ncols=1, \*\*kwargs*)

Return a [GridSpec](#) that has this figure as a parent. This allows complex layout of Axes in the figure.

**Parameters****nrows**

[int, default: 1] Number of rows in grid.

**ncols**

[int, default: 1] Number or columns in grid.

**Returns**

[GridSpec](#)

**Other Parameters****\*\*kwargs**

Keyword arguments are passed to [GridSpec](#).

**See also:**

[matplotlib.pyplot.subplots](#)

## Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

**add\_subfigure**(*self*, *subplotspec*, \*\**kwargs*)

Add a *SubFigure* to the figure as part of a subplot arrangement.

### Parameters

#### subplotspec

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

### Returns

*figure.SubFigure*

### Other Parameters

#### \*\*kwargs

Are passed to the *SubFigure* object.

### See also:

*Figure.subfigures*

**add\_subplot**(*self*, \**args*, \*\**kwargs*)

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

### Parameters

#### \*args

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

In rare circumstances, `add_subplot` may be called with a single argument, a subplot Axes instance already created in the present figure but not in the figure's list of Axes.

### projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (`Axes`). *str* is the name of a custom projection, see `projections`. The default None results in a 'rectilinear' projection.

### polar

[bool, default: False] If True, equivalent to `projection='polar'`.

### axes\_class

[subclass type of `Axes`, optional] The `axes.Axes` subclass that is instantiated. This parameter is incompatible with `projection` and `polar`. See `axisartist` for examples.

### sharex, sharey

[`Axes`, optional] Share the x or y `axis` with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

### label

[str] A label for the returned Axes.

## Returns

`axes.SubplotBase`, or another subclass of `Axes`

The Axes of the subplot. The returned Axes base class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used. The returned Axes is then a subplot subclass of the base class.

## Other Parameters

**\*\*kwargs**

This method also takes the keyword arguments for the returned Axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<code>Figure</code>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <code>Bbox</code>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str

continues on next

Table 135 – continued from previous page

Property	Description
<code>xlim</code>	(bottom: float, top: float)
<code>xmargin</code>	float greater than -0.5
<code>xscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>xticklabels</code>	unknown
<code>xticks</code>	unknown
<code>ybound</code>	unknown
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>yticklabels</code>	unknown
<code>yticks</code>	unknown
<code>zorder</code>	float

See also:

`Figure.add_axes`  
`pyplot.subplot`  
`pyplot.axes`  
`Figure.subplots`  
`pyplot.subplots`

## Examples

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1) # equivalent but more general

fig.add_subplot(232, frameon=False) # subplot with no frame
fig.add_subplot(233, projection='polar') # polar subplot
fig.add_subplot(234, sharex=ax1) # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red") # red subplot

ax1.remove() # delete ax1 from the figure
fig.add_subplot(ax1) # add ax1 back to the figure
```

### `align_labels(self, axs=None)`

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

#### Parameters

**axs**

[list of `Axes`] Optional list (or ndarray) of `Axes` to align the labels. Default is to align all Axes on the figure.

**See also:**

`matplotlib.figure.Figure.align_xlabels`  
`matplotlib.figure.Figure.align_ylabels`

**align\_xlabels (self, axs=None)**

Align the xlabel of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on Axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on Axes with the same top-most row.

**Parameters****axs**

[list of `Axes`] Optional list of (or ndarray) `Axes` to align the xlabel. Default is to align all Axes on the figure.

**See also:**

`matplotlib.figure.Figure.align_ylabels`  
`matplotlib.figure.Figure.align_labels`

**Notes**

This assumes that `axs` are from the same `GridSpec`, so that their `SubplotSpec` positions correspond to figure positions.

**Examples**

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

**align\_ylabels**(*self, axs=None*)

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on Axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on Axes with the same right-most column.

**Parameters****axs**

[list of [Axes](#)] Optional list (or ndarray) of [Axes](#) to align the ylabels. Default is to align all Axes on the figure.

**See also:**

[`matplotlib.figure.Figure.align\_xlabels`](#)

[`matplotlib.figure.Figure.align\_labels`](#)

**Notes**

This assumes that `axs` are from the same [GridSpec](#), so that their [SubplotSpec](#) positions correspond to figure positions.

**Examples**

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

**autofmt\_xdate**(*self, bottom=0.2, rotation=30, ha='right', which='major'*)

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared x-axis where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabel.

**Parameters****bottom**

[float, default: 0.2] The bottom of the subplots for [subplots\\_adjust](#).

**rotation**

[float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

**ha**

[{'left', 'center', 'right'}, default: 'right'] The horizontal alignment of the xticklabels.

**which**

[{'major', 'minor', 'both'}, default: 'major'] Selects which ticklabels to rotate.

**property axes**

List of Axes in the Figure. You can access and modify the Axes in the Figure through this list.

Do not modify the list itself. Instead, use "`add_axes`, `add_subplot` or `delaxes` to add or remove an Axes.

**clear (self, keep\_observers=False)**

Clear the figure -- synonym for `clf`.

**clf (self, keep\_observers=False)**

Clear the figure.

Set `keep_observers` to True if, for example, a gui widget is tracking the Axes in the figure.

**colorbar (self, mappable, cax=None, ax=None, use\_gridspec=True, \*\*kw)**

Add a colorbar to a plot.

**Parameters****mappable**

The `matplotlib.cm.ScalarMappable` (i.e., `AxesImage`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure.colorbar` method but optional for the `pyplot.colorbar` function, which sets the default to the current image.

Note that one can create a `ScalarMappable` "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),  
            ax=ax)
```

**cax**

[`Axes`, optional] Axes into which the colorbar will be drawn.

**ax**

[`Axes`, list of Axes, optional] One or more parent axes from which space for a new colorbar axes will be stolen, if `cax` is None. This has no effect if `cax` is set.

**use\_gridspec**

[bool, optional] If `cax` is `None`, a new `cax` is created as an instance of `Axes`. If `ax` is an instance of `Subplot` and `use_gridspec` is `True`, `cax` is created as an instance of `Subplot` using the `gridspec` module.

## Returns

### **colorbar**

[`Colorbar`] See also its base class, `ColorbarBase`.

## Notes

Additional keyword arguments are of two kinds:

axes properties:

### **location**

[`None` or `{'left', 'right', 'top', 'bottom'}`] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If `None`, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to `'right'` if *orientation* is unset.

### **orientation**

[`None` or `{'vertical', 'horizontal'}`] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

### **fraction**

[float, default: 0.15] Fraction of original axes to use for colorbar.

### **shrink**

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

### **aspect**

[float, default: 20] Ratio of long to short dimensions.

### **pad**

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

### **anchor**

[(float, float), optional] The anchor point of the colorbar axes. Defaults to `(0.0, 0.5)` if vertical; `(0.5, 1.0)` if horizontal.

**panchor**

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Prop- erty	Description
<i>ex-</i> <i>tend</i>	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<i>ex-</i> <i>tend-</i> <i>frac</i>	{ <i>None</i> , 'auto', length, lengths} If set to <i>None</i> , both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when <i>spacing</i> is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when <i>spacing</i> is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
<i>ex-</i> <i>ten-</i> <i>drect</i>	bool If <i>False</i> the minimum and maximum colorbar extensions will be triangular (the default). If <i>True</i> the extensions will be rectangular.
<i>spac-</i> <i>ing</i>	{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<i>ticks</i>	<i>None</i> or list of ticks or Locator If None, ticks are determined automatically from the input.
<i>for-</i> <i>mat</i>	<i>None</i> or str or Formatter If None, <code>ScalarFormatter</code> is used. If a format string is given, e.g., '%.3f', that is used. An alternative <code>For-</code> <code>matter</code> may be given instead.
<i>drawed-</i> <i>lines</i>	bool Whether to draw lines at color boundaries.
<i>la-</i> <i>bel</i>	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Property	Description
<i>boundaries</i>	None or a sequence
<i>values</i>	None or a sequence which must be of length 1 less than the sequence of <i>boundaries</i> . For each region delimited by adjacent entries in <i>boundaries</i> , the colormapped to the corresponding value in <i>values</i> will be used.

If *mappable* is a [ContourSet](#), its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar and *shrink* and *aspect* kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images ( $\alpha < 1$ ) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

### **contains** (*self, mouseevent*)

Test whether the mouse event occurred on the figure.

#### **Returns**

**bool, {}**

### **convert\_xunits** (*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

### **convert\_yunits** (*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

### **delaxes** (*self, ax*)

Remove the [Axes](#) *ax* from the figure; update the current Axes.

### **property dpi**

The resolution in dots per inch.

**draw**(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

**Parameters****renderer**

[*RendererBase* subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**draw\_artist**(*self, a*)

Draw *Artist a* only.

This method can only be used after an initial draw of the figure, because that creates and caches the renderer needed here.

**execute\_constrained\_layout**(*self, renderer=None*)

Use *layoutgrid* to determine pos positions within Axes.

See also *set\_constrained\_layout\_pads*.

**figimage**(*self, X, xo=0, yo=0, alpha=None, norm=None, cmap=None, vmin=None,*

*vmax=None, origin=None, resize=False, \*\*kwargs*)

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

**Parameters****X**

The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

**xo, yo**

[int] The x/y image offset in pixels.

**alpha**

[None or float] The alpha blending value.

**norm**

[*matplotlib.colors.Normalize*] A *Normalize* instance to map the luminance to the interval [0, 1].

**cmap**

[str or `matplotlib.colors.Colormap`, default: `rcParams["image.cmap"]`] (default: 'viridis')] The colormap to use.

**vmin, vmax**

[float] If `norm` is not given, these values set the data limits for the colormap.

**origin**

[{'upper', 'lower'}, default: `rcParams["image.origin"]`] (default: 'upper') Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

**resize**

[bool] If `True`, resize the figure to match the given image size.

**Returns**

`matplotlib.image.FigureImage`

**Other Parameters****\*\*kwargs**

Additional kwargs are `Artist` kwargs passed on to `FigureImage`.

**Notes**

`figimage` complements the Axes image (`imshow`) which will be resampled to fit the current Axes. If you want a resampled image to fill the entire figure, you can define an `Axes` with extent [0, 0, 1, 1].

**Examples**

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

**findobj** (*self, match=None, include\_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

**Parameters**

**match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`.  
The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**

[bool] Include *self* in the list to be checked for a match.

**Returns**

**list of *Artist***

**format\_cursor\_data(self, data)**

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

**property frameon**

Return the figure's background patch visibility, i.e. whether the figure background will be drawn.  
Equivalent to `Figure.patch.get_visible()`.

**gca(self, \*\*kwargs)**

Get the current Axes, creating one if necessary.

The following kwargs are supported for ensuring the returned Axes adheres to the given projection etc., and for Axes creation if the active Axes does not exist:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float

continues on next

Table 136 – continued from previous page

Property	Description
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<i>Figure</i>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <i>Bbox</i>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<i>Transform</i>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str
<code>xlim</code>	(bottom: float, top: float)
<code>xmargin</code>	float greater than -0.5
<code>xscale</code>	{"linear", "log", "symlog", "logit", ...} or <i>ScaleBase</i>
<code>xticklabels</code>	unknown
<code>xticks</code>	unknown
<code>ybound</code>	unknown
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...} or <i>ScaleBase</i>
<code>yticklabels</code>	unknown

continues on next

Table 136 – continued from previous page

Property	Description
<code>yticks</code>	unknown
<code>zorder</code>	float

**get\_agg\_filter(self)**

Return filter function to be used for agg filter.

**get\_alpha(self)**

Return the alpha value used for blending - not supported on all backends.

**get\_animated(self)**

Return whether the artist is animated.

**get\_axes(self)**

Return a list of Axes in the Figure. You can access and modify the Axes in the Figure through this list.

Do not modify the list itself. Instead, use `add_axes`, `add_subplot` or `delaxes` to add or remove an Axes.

Note: This is equivalent to the property `axes`.

**get\_children(self)**

Get a list of artists contained in the figure.

**get\_clip\_box(self)**

Return the clipbox.

**get\_clip\_on(self)**

Return whether the artist uses clipping.

**get\_clip\_path(self)**

Return the clip path.

**get\_constrained\_layout(self)**

Return whether constrained layout is being used.

See [Constrained Layout Guide](#).

**get\_constrained\_layout\_pads(self, relative=False)**

Get padding for `constrained_layout`.

Returns a list of `w_pad`, `h_pad` in inches and `wspace` and `hspace` as fractions of the subplot.

See [Constrained Layout Guide](#).

**Parameters****relative**

[bool] If `True`, then convert from inches to figure relative.

**get\_contains (self)**

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

**set\_contains****Notes**

Deprecated since version 3.3.

**get\_cursor\_data (self, event)**

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters****event**

[*matplotlib.backend\_bases.MouseEvent*]

See also:

**format\_cursor\_data****get\_default\_bbox\_extra\_artists (self)****get\_dpi (self)**

Return the resolution in dots per inch as a float.

**get\_edgecolor (self)**

Get the edge color of the Figure rectangle.

**get\_facecolor (self)**

Get the face color of the Figure rectangle.

**get\_figheight (self)**

Return the figure height in inches.

**get\_figure(self)**

Return the *Figure* instance the artist belongs to.

**get\_figwidth(self)**

Return the figure width in inches.

**get\_frameon(self)**

Return the figure's background patch visibility, i.e. whether the figure background will be drawn.  
Equivalent to `Figure.patch.get_visible()`.

**get\_gid(self)**

Return the group id.

**get\_in\_layout(self)**

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_label(self)**

Return the label used for this artist in the legend.

**get\_linewidth(self)**

Get the line width of the Figure rectangle.

**get\_path\_effects(self)****get\_picker(self)**

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`

**get\_rasterized(self)**

Return whether the artist is to be rasterized.

**get\_size\_inches(self)**

Return the current size of the figure in inches.

**Returns****ndarray**

The size (width, height) of the figure in inches.

**See also:**

`matplotlib.figure.Figure.set_size_inches`

`matplotlib.figure.Figure.get_figwidth`

`matplotlib.figure.Figure.get_figheight`

## Notes

The size in pixels can be obtained by multiplying with `Figure.dpi`.

### `get_sketch_params(self)`

Return the sketch parameters for the artist.

#### Returns

##### `tuple or None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

Returns `None` if no sketch parameters were set.

### `get_snap(self)`

Return the snap setting.

See `set_snap` for details.

### `get_tight_layout(self)`

Return whether `tight_layout` is called when drawing.

### `get_tightbbox(self, renderer, bbox_extra_artists=None)`

Return a (tight) bounding box of the figure in inches.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

#### Parameters

##### `renderer`

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

##### `bbox_extra_artists`

[list of `Artist` or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of each Axes are included in the tight bounding box.

#### Returns

##### `BboxBase`

containing the bounding box (in figure inches).

### `get_transform(self)`

Return the `Transform` instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine**(*self*)

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_url**(*self*)

Return the url.

**get\_visible**(*self*)

Return the visibility.

**get\_window\_extent**(*self*, \**args*, \*\**kwargs*)

Return the figure bounding box in display space. Arguments are ignored.

**get\_zorder**(*self*)

Return the artist's zorder.

**ginput**(*self*, *n*=1, *timeout*=30, *show\_clicks*=True, *mouse\_add*=<*MouseButton.LEFT*: 1>,  
*mouse\_pop*=<*MouseButton.RIGHT*: 3>, *mouse\_stop*=<*MouseButton.MIDDLE*:  
2>)

Blocking call to interact with a figure.

Wait until the user clicks *n* times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments *mouse\_add*, *mouse\_pop* and *mouse\_stop*.

### Parameters

**n**

[int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

**timeout**

[float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

**show\_clicks**

[bool, default: True] If True, show a red cross at the location of each click.

**mouse\_add**

[*MouseButton* or None, default: *MouseButton.LEFT*] Mouse button used to add points.

**mouse\_pop**

[`MouseButton` or `None`, default: `MouseButton.RIGHT`] Mouse button used to remove the most recently added point.

### `mouse_stop`

[`MouseButton` or `None`, default: `MouseButton.MIDDLE`] Mouse button used to stop input.

### Returns

#### `list of tuples`

A list of the clicked (x, y) coordinates.

### Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

#### `have_units(self)`

Return whether units are set on any axis.

#### `init_layoutgrid(self)`

Initialize the layoutgrid for use in constrained\_layout.

#### `is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

#### `legend(self, *args, **kwargs)`

Place a legend on the figure.

Call signatures:

```
legend()  
legend(labels)  
legend(handles, labels)
```

The call signatures correspond to these three different ways to use this method:

#### 1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')  
fig.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
fig.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Figure.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

## 2. Labeling existing plot elements

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
ax1.plot([1, 3, 5], color='blue')
ax2.plot([2, 4, 6], color='red')
fig.legend(['the blues', 'the reds'])
```

Note: This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

## 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
fig.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

## Parameters

### handles

[list of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

### labels

[list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

## Returns

### `Legend`

## Other Parameters

**loc**

[str or pair of floats, default: `rcParams["legend.loc"]`] (default: 'best') ('best' for axes, 'upper right' for figures) The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor**

[`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (*x*, *y*, *width*, *height*) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (*x*, *y*) places the corner of the legend specified by *loc* at *x*, *y*. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

### **ncol**

[int, default: 1] The number of columns that the legend has.

### **prop**

[None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

### **fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

### **labelcolor**

[str or list] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

### **numpoints**

[int, default: *rcParams*["legend.numpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

### **scatterpoints**

[int, default: *rcParams*["legend.scatterpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

### **scatteryoffsets**

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale**

[float, default: `rcParams["legend.markerscale"]` (default: 1.0)]  
The relative size of legend markers compared with the originally drawn ones.

**markerfirst**

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

**frameon**

[bool, default: `rcParams["legend.frameon"]` (default: True)]  
Whether the legend should be drawn on a patch (frame).

**fancybox**

[bool, default: `rcParams["legend.fancybox"]` (default: True)]  
Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.

**shadow**

[bool, default: `rcParams["legend.shadow"]` (default: False)]  
Whether to draw a shadow behind the legend.

**framealpha**

[float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

**facecolor**

[`"inherit"` or color, default: `rcParams["legend.facecolor"]` (default: '`inherit`')]  
The legend's background color. If "`inherit`", use `rcParams["axes.facecolor"]` (default: '`white`').

**edgecolor**

[`"inherit"` or color, default: `rcParams["legend.edgecolor"]` (default: '`0.8`')]  
The legend's background patch edge color. If "`inherit`", use take `rcParams["axes.edgecolor"]` (default: '`black`').

**mode**

[`{"expand", None}`] If *mode* is set to "`expand`" the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend's size).

**bbox\_transform**

[`None` or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.

**title**

[str or `None`] The legend's title. Default is no title (`None`).

**title\_fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: None)] The font size of the legend's title.

**borderpad**

[float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing**

[float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.

**handlelength**

[float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.

**handletextpad**

[float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.

**borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)] The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: `rcParams["legend.columnspacing"]` (default: 2.0)] The spacing between columns, in font-size units.

**handler\_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

**See also:**

`Axes.legend`

## Notes

Some artists are not supported by this function. See [Legend guide](#) for details.

### **property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also [get\\_cursor\\_data\(\)](#), [ToolCursorPosition](#) and [NavigationToolbar2](#).

### **pchanged(self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

[add\\_callback](#)

[remove\\_callback](#)

### **pick(self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

[set\\_picker](#), [get\\_picker](#), [pickable](#)

### **pickable(self)**

Return whether the artist is pickable.

See also:

[set\\_picker](#), [get\\_picker](#), [pick](#)

### **properties(self)**

Return a dictionary of all the properties of the artist.

### **remove(self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with [FigureCanvasBase.draw\\_idle](#). Call [relim](#) to update the axes limits if desired.

Note: [relim](#) will not see collections even if the collection was added to the axes with *autolim* = *True*.

Note: there is no support for removing the artist's legend entry.

### **remove\_callback(self, oid)**

Remove a callback based on its observer id.

See also:

**`add_callback`**

**`savefig(self, fname, *, transparent=None, **kwargs)`**

Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

### Parameters

#### **`fname`**

[str or path-like or binary file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

If `format` is set, it determines the output format, and the file is saved as `fname`. Note that `fname` is used verbatim, and there is no attempt to make the extension, if any, of `fname` match `format`, and no extension is appended.

If `format` is not set, then the format is inferred from the extension of `fname`, if there is one. If `format` is not set and `fname` has no extension, then the file is saved with `rcParams["savefig.format"]` (default: 'png') and the appropriate extension is appended to `fname`.

### Other Parameters

#### **`dpi`**

[float or 'figure', default: `rcParams["savefig.dpi"]`] (default: 'figure') The resolution in dots per inch. If 'figure', use the figure's dpi value.

#### **`quality`**

[int, default: `rcParams["savefig.jpeg_quality"]`] (default: 95) Applicable only if `format` is 'jpg' or 'jpeg', ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

#### **`optimize`**

[bool, default: False] Applicable only if `format` is 'jpg' or 'jpeg', ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

**progressive**

[bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

**facecolor**

[color or 'auto', default: `rcParams["savefig.facecolor"]`] (default: 'auto') The facecolor of the figure. If 'auto', use the current figure facecolor.

**edgecolor**

[color or 'auto', default: `rcParams["savefig.edgecolor"]`] (default: 'auto') The edgecolor of the figure. If 'auto', use the current figure edgecolor.

**orientation**

[{'landscape', 'portrait'}] Currently only supported by the postscript backend.

**papertype**

[str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

**format**

[str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

**transparent**

[bool] If *True*, the Axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

**bbox\_inches**

[str or *Bbox*, default: `rcParams["savefig.bbox"]`] (default: None) Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

**pad\_inches**

[float, default: `rcParams["savefig.pad_inches"]`] (default: 0.1) Amount of padding around the figure when *bbox\_inches* is 'tight'.

**bbox\_extra\_artists**

[list of [Artist](#), optional] A list of extra artists that will be considered when the tight bbox is calculated.

**backend**

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See [The builtin backends](#) for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

**metadata**

[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter `metadata` of [print\\_png](#).
- 'pdf' with pdf backend: See the parameter `metadata` of [PdfPages](#).
- 'svg' with svg backend: See the parameter `metadata` of [print\\_svg](#).
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

**pil\_kwarg**

[dict, optional] Additional keyword arguments that are passed to [PIL.Image](#).  
`Image.save` when saving the figure.

**sca** (*self, a*)

Set the current Axes to be *a* and return *a*.

**set** (*self, \*\*kwargs*)

A property batch setter. Pass *kwargs* to set properties.

**set\_agg\_filter** (*self, filter\_func*)

Set the agg filter.

**Parameters****filter\_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set\_alpha** (*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

**Parameters****alpha**

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

**set\_animated**(*self*, *b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure\*.draw\\_artist](#)/[\*Axes\*.draw\\_artist](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

**Parameters****b**

[bool]

**set\_canvas**(*self*, *canvas*)

Set the canvas that contains the figure

**Parameters****canvas**

[FigureCanvas]

**set\_clip\_box**(*self*, *clipbox*)

Set the artist's clip [\*Bbox\*](#).

**Parameters****clipbox**

[[\*Bbox\*](#)]

**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters****path**

[[\*Patch\*](#) or [\*Path\*](#) or [\*TransformedPath\*](#) or None] The clip path. If given a [\*Path\*](#), *transform* must be provided as well. If *None*, a previously set clip path is removed.

## transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

## Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

### `set_constrained_layout(self, constrained)`

Set whether `constrained_layout` is used upon drawing. If None, `rcParams["figure.constrained_layout.use"]` (default: `False`) value will be used.

When providing a dict containing the keys `w_pad`, `h_pad` the default `constrained_layout` paddings will be overridden. These pads are in inches and default to 3.0/72.0. `w_pad` is the width padding and `h_pad` is the height padding.

See [Constrained Layout Guide](#).

## Parameters

### **constrained**

[bool or dict or None]

### `set_constrained_layout_pads(self, **kwargs)`

Set padding for `constrained_layout`. Note the kwargs can be passed as a dictionary `fig.set_constrained_layout(**paddict)`.

See [Constrained Layout Guide](#).

## Parameters

### **w\_pad**

[float] Width padding in inches. This is the pad around Axes and is meant to make sure there is enough room for fonts to look good. Defaults to 3 pts = 0.04167 inches

### **h\_pad**

[float] Height padding in inches. Defaults to 3 pts.

### **wspace**

[float] Width padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being `w_pad + wspace`.

**hspace**

[float] Height padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being h\_pad + hspace.

**set\_contains (self, picker)**

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool,  
            dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set\_dpi (self, val)**

Set the resolution of the figure in dots-per-inch.

**Parameters****val**

[float]

**set\_edgecolor (self, color)**

Set the edge color of the Figure rectangle.

**Parameters****color**

[color]

**set\_facecolor (self, color)**

Set the face color of the Figure rectangle.

## Parameters

### color

[color]

### `set_figheight(self, val, forward=True)`

Set the height of the figure in inches.

## Parameters

### val

[float]

### forward

[bool] See `set_size_inches`.

## See also:

`matplotlib.figure.Figure.set_figwidth`

`matplotlib.figure.Figure.set_size_inches`

### `set_figure(self, fig)`

Set the `Figure` instance the artist belongs to.

## Parameters

### fig

[`Figure`]

### `set_figwidth(self, val, forward=True)`

Set the width of the figure in inches.

## Parameters

### val

[float]

### forward

[bool] See `set_size_inches`.

## See also:

`matplotlib.figure.Figure.set_figheight`

`matplotlib.figure.Figure.set_size_inches`

**set\_frameon**(*self*, *b*)

Set the figure's background patch visibility, i.e. whether the figure background will be drawn.  
Equivalent to `Figure.patch.set_visible()`.

**Parameters****b**

[bool]

**set\_gid**(*self*, *gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_in\_layout**(*self*, *in\_layout*)

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters****in\_layout**

[bool]

**set\_label**(*self*, *s*)

Set a label that will be displayed in the legend.

**Parameters****s**

[object] *s* will be converted to a string by calling `str`.

**set\_linewidth**(*self*, *linewidth*)

Set the line width of the Figure rectangle.

**Parameters****linewidth**

[number]

**set\_path\_effects**(*self*, *path\_effects*)

Set the path effects.

**Parameters**

**path\_effects**

[*AbstractPathEffect*]

**set\_picker**(*self, picker*)

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters****rasterized**

[bool]

**set\_size\_inches**(*self, w, h=None, forward=True*)

Set the figure size in inches.

Call signatures:

```
fig.set_size_inches(w, h)    # OR  
fig.set_size_inches((w, h))
```

## Parameters

### w

[(float, float) or float] Width and height in inches (if height not specified as a separate argument) or width.

### h

[float] Height in inches.

### forward

[bool, default: True] If `True`, the canvas size is automatically updated, e.g., you can resize the figure window from the shell.

## See also:

`matplotlib.figure.Figure.get_size_inches`  
`matplotlib.figure.Figure.set_figwidth`  
`matplotlib.figure.Figure.set_figheight`

## Notes

To transform from pixels to inches divide by `Figure.dpi`.

`set_sketch_params(self, scale=None, length=None, randomness=None)`  
Set the sketch parameters.

## Parameters

### scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

### length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

### randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(self, snap)`  
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

### Parameters

#### **snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

#### **set\_tight\_layout(self, tight)**

Set whether and how *tight\_layout* is called when drawing.

### Parameters

#### **tight**

[bool or dict with keys "pad", "w\_pad", "h\_pad", "rect" or None] If a bool, sets whether to call *tight\_layout* upon drawing. If None, use the `figure.autolayout` reparam instead. If a dict, pass it as kwargs to *tight\_layout*, overriding the default paddings.

#### **set\_transform(self, t)**

Set the artist transform.

### Parameters

#### **t**

[*Transform*]

#### **set\_url(self, url)**

Set the url for the artist.

### Parameters

#### **url**

[str]

#### **set\_visible(self, b)**

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder(self, level)**

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**show(self, warn=True)**

If using a GUI backend with pyplot, display the figure window.

If the figure was not created using [\*Figure\*](#), it will lack a [\*FigureManagerBase\*](#), and this method will raise an `AttributeError`.

**Warning:** This does not manage an GUI event loop. Consequently, the figure may only be shown briefly or not shown at all if you or your environment are not managing an event loop.

Proper use cases for [\*Figure.show\*](#) include running this from a GUI application or an IPython shell.

If you're running a pure python shell or executing a non-GUI python script, you should use [\*matplotlib.pyplot.show\*](#) instead, which takes care of managing the event loop for you.

**Parameters****warn**

[bool, default: True] If True and we are not running headless (i.e. on Linux with an unset DISPLAY), issue warning when called on a non-GUI backend.

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**subfigures**(*self*, *nrows*=1, *ncols*=1, *squeeze*=True, *wspace*=None, *hspace*=None, *width\_ratios*=None, *height\_ratios*=None, *\*\*kwargs*)  
Add a subfigure to this figure or subfigure.

A subfigure has the same artist methods as a figure, and is logically the same as a figure, but cannot print itself. See /gallery/subplots\_axes\_and\_figures/subfigures.

### Parameters

#### **nrows, ncols**

[int, default: 1] Number of rows/columns of the subfigure grid.

#### **squeeze**

[bool, default: True] If True, extra dimensions are squeezed out from the returned array of subfigures.

#### **wspace, hspace**

[float, default: None] The amount of width/height reserved for space between subfigures, expressed as a fraction of the average subfigure width/height. If not given, the values will be inferred from a figure or rcParams when necessary.

#### **width\_ratios**

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of *width\_ratios*[*i*] / sum(*width\_ratios*). If not given, all columns will have the same width.

#### **height\_ratios**

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of *height\_ratios*[*i*] / sum(*height\_ratios*). If not given, all rows will have the same height.

**subplot\_mosaic**(*self*, *mosaic*, \*, *subplot\_kw*=None, *gridspec\_kw*=None, *empty\_sentinel*='.')

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

---

**Note:** This API is provisional and may be revised in the future based on early user feedback.

### Parameters

#### **mosaic**

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [[ 'A panel', 'A panel', 'edge'],
      ['C panel', '.', 'edge']]
```

Produces 4 Axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which is 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it can either be a multi-line string of the form

```
''
AAE
C.E
'''
```

where each character is a column and each line is a row. Or it can be a single-line string where rows are separated by ;:

```
'AB;CC'
```

The string notation allows only single character Axes labels and does not support nesting but is very terse.

#### **subplot\_kw**

[dict, optional] Dictionary with keywords passed to the *Figure.add\_subplot* call used to create each subplot.

#### **gridspec\_kw**

[dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

#### **empty\_sentinel**

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to ' . '. Note, if *layout* is a string, it is processed via *inspect.cleandoc* to remove leading white space, which may interfere with using white-space as the empty sentinel.

### **Returns**

**dict[label, Axes]**

A dictionary mapping the labels to the Axes objects. The order of the axes is left-to-right and top-to-bottom of their position in the total layout.

**subplots** (*self*, *nrows*=1, *ncols*=1, \*, *sharex*=*False*, *sharey*=*False*, *squeeze*=*True*, *subplot\_kw*=*None*, *gridspec\_kw*=*None*)  
Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

### Parameters

#### **nrows, ncols**

[int, default: 1] Number of rows/columns of the subplot grid.

#### **sharex, sharey**

[bool or {'none', 'all', 'row', 'col'}, default: *False*] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick\_params*.

When subplots have a shared axis that has units, calling *Axis.set\_units* will update each axis with the new units.

#### **squeeze**

[bool, default: *True*]

- If *True*, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (*nrows*=*ncols*=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If *False*, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

#### **subplot\_kw**

[dict, optional] Dict with keywords passed to the *Figure.add\_subplot* call used to create each subplot.

**gridspec\_kw**

[dict, optional] Dict with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**Returns****Axes or array of Axes**

Either a single `Axes` object or an array of `Axes` objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the `squeeze` keyword, see above.

**See also:**

`pyplot.subplots`

`Figure.add_subplot`

`pyplot.subplot`

**Examples**

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar Axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(projection='polar'))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')
```

(continues on next page)

(continued from previous page)

```
# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

**subplots\_adjust**(*self*, *left*=*None*, *bottom*=*None*, *right*=*None*, *top*=*None*, *wspace*=*None*, *hspace*=*None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"]`.

### Parameters

#### left

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

#### right

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

#### bottom

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

#### top

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

#### wspace

[float, optional] The width of the padding between subplots, as a fraction of the average Axes width.

#### hspace

[float, optional] The height of the padding between subplots, as a fraction of the average Axes height.

**suptitle**(*self*, *t*, *\*\*kwargs*)

Add a centered suptitle to the figure.

### Parameters

#### t

[str] The suptitle text.

**x**

[float, default: 0.5] The x location of the text in figure coordinates.

**y**

[float, default: 0.98] The y location of the text in figure coordinates.

**horizontalalignment, ha**

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: top] The vertical alignment of the text relative to (x, y).

**fontsize, size**

[default: `rcParams["figure.titlesize"]` (default: 'large')] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight**

[default: `rcParams["figure.titleweight"]` (default: 'normal')] The font weight of the text. See `Text.set_weight` for possible values.

## Returns

**text**

The `Text` instance of the suptitle.

## Other Parameters

**fontproperties**

[None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

**supxlabel(*self, t, \*\*kwargs*)**

Add a centered sup xlabel to the figure.

## Parameters

**t**

[str] The sup xlabel text.

**x**

[float, default: 0.5] The x location of the text in figure coordinates.

**y**

[float, default: 0.01] The y location of the text in figure coordinates.

**horizontalalignment, ha**

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: bottom] The vertical alignment of the text relative to (x, y).

**fontsize, size**

[default: `rcParams["figure.titlesize"]` (default: 'large')] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight**

[default: `rcParams["figure.titleweight"]` (default: 'normal')] The font weight of the text. See `Text.set_weight` for possible values.

## Returns

**text**

The `Text` instance of the supxlabel.

## Other Parameters

**fontproperties**

[None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

**supylabel**(*self, t, \*\*kwargs*)

Add a centered supylabel to the figure.

## Parameters

**t**

[str] The supylabel text.

**x**

[float, default: 0.02] The x location of the text in figure coordinates.

**y**

[float, default: 0.5] The y location of the text in figure coordinates.

**horizontalalignment, ha**

[{'center', 'left', 'right'}, default: left] The horizontal alignment of the text relative to  $(x, y)$ .

**verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: center] The vertical alignment of the text relative to  $(x, y)$ .

**fontsize, size**

[default: `rcParams["figure.titlesize"]`] (default: 'large')] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight**

[default: `rcParams["figure.titleweight"]`] (default: 'normal')] The font weight of the text. See `Text.set_weight` for possible values.

## Returns

**text**

The `Text` instance of the supylabel.

## Other Parameters

**fontproperties**

[None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

**text** (*self*, *x*, *y*, *s*, *fontdict=None*, **\*\*kwargs**)

Add text to figure.

## Parameters

**x, y**

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

**s**

[str] The text string.

**fontdict**

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as `kwargs` override the corresponding ones given in `fontdict`.

## Returns

**Text**

## Other Parameters

**\*\*kwargs**

[*Text* properties] Other miscellaneous text parameters.

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) bool array for indexing valid pixels
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <code>patches.FancyBboxPatch</code>
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code> or <code>family</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code> or <code>font</code> or <code>font_properties</code>	<code>font_manager.FontProperties</code> or str or <code>pathlib.Path</code>
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'normal', 'semi-condensed', 'semi-expanded', 'expanded'}
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'bold', 'black'}
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)

Table 137 – continued from pr

Property	Description
<code>math_fontfamily</code>	str
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None

<code>y</code>	float
<code>zorder</code>	float

**See also:**`Axes.text``pyplot.text``tight_layout(self, *, pad=1.08, h_pad=None, w_pad=None, rect=None)`

Adjust the padding between and around subplots.

To exclude an artist on the Axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), set `a.set_in_layout(False)` for that artist.**Parameters****pad**

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad**[float, default: `pad`] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.**rect**

[tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

### See also:

`Figure.set_tight_layout`

`pyplot.tight_layout`

**update** (*self, props*)

Update this artist's properties from the dict *props*.

### Parameters

**props**

[dict]

**update\_from** (*self, other*)

Copy properties from *other* to *self*.

**waitforbuttonpress** (*self, timeout=-1*)

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.

**zorder = 0**

**class** matplotlib.figure.**FigureBase**

Base class for `Figure` and `SubFigure` containing the methods that add artists to the figure or subfigure, create Axes, etc.

**add\_artist** (*self, artist, clip=False*)

Add an `Artist` to the figure.

Usually artists are added to Axes objects using `Axes.add_artist`; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

### Parameters

**artist**

[`Artist`] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transSubfigure`.

**clip**

[bool, default: False] Whether the added artist should be clipped by the figure patch.

### Returns

### **Artist**

The added artist.

#### **add\_axes** (*self*, \**args*, \*\**kwargs*)

Add an Axes to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

### **Parameters**

#### **rect**

[sequence of float] The dimensions [left, bottom, width, height] of the new Axes.  
All quantities are in fractions of figure width and height.

#### **projection**

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the `Axes`. *str* is the name of a custom projection, see `projections`. The default None results in a 'rectilinear' projection.

#### **polar**

[bool, default: False] If True, equivalent to `projection='polar'`.

#### **axes\_class**

[subclass type of `Axes`, optional] The `axes.Axes` subclass that is instantiated. This parameter is incompatible with `projection` and `polar`. See `axisartist` for examples.

#### **sharex, sharey**

[`Axes`, optional] Share the x or y `axis` with `sharex` and/or `sharey`. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

#### **label**

[str] A label for the returned Axes.

### **Returns**

#### **Axes, or a subclass of Axes**

The returned axes class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used.

### **Other Parameters**

**\*\*kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<code>Figure</code>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <code>Bbox</code>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str

continues on next

Table 138 – continued from previous page

Property	Description
<code>xlim</code>	(bottom: float, top: float)
<code>xmargin</code>	float greater than -0.5
<code>xscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>xticklabels</code>	unknown
<code>xticks</code>	unknown
<code>ybound</code>	unknown
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>yticklabels</code>	unknown
<code>yticks</code>	unknown
<code>zorder</code>	float

See also:

`Figure.add_subplot`  
`pyplot.subplot`  
`pyplot.axes`  
`Figure.subplots`  
`pyplot.subplots`

## Notes

In rare circumstances, `add_axes` may be called with a single argument, an Axes instance already created in the present figure but not in the figure's list of Axes.

## Examples

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

### `add_callback(self, func)`

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

## Parameters

### func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

## Returns

### int

The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

## See also:

[\*remove\\_callback\*](#)

**add\_gridspec**(self, nrows=1, ncols=1, \*\*kwargs)

Return a *GridSpec* that has this figure as a parent. This allows complex layout of Axes in the figure.

## Parameters

### nrows

[int, default: 1] Number of rows in grid.

### ncols

[int, default: 1] Number or columns in grid.

## Returns

*GridSpec*

## Other Parameters

### \*\*kwargs

Keyword arguments are passed to *GridSpec*.

## See also:

[\*matplotlib.pyplot.subplots\*](#)

## Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

**add\_subfigure** (*self*, *subplotspec*, \*\**kwargs*)

Add a *SubFigure* to the figure as part of a subplot arrangement.

### Parameters

#### **subplotspec**

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

### Returns

*figure.SubFigure*

### Other Parameters

#### **\*\*kwargs**

Are passed to the *SubFigure* object.

### See also:

*Figure.subfigures*

**add\_subplot** (*self*, \**args*, \*\**kwargs*)

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

### Parameters

#### **\*args**

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

In rare circumstances, `add_subplot` may be called with a single argument, a subplot Axes instance already created in the present figure but not in the figure's list of Axes.

### projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see [projections](#). The default None results in a 'rectilinear' projection.

### polar

[bool, default: False] If True, equivalent to `projection='polar'`.

### axes\_class

[subclass type of *Axes*, optional] The `axes.Axes` subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See [axisartist](#) for examples.

### sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

### label

[str] A label for the returned Axes.

## Returns

`axes.SubplotBase`, or another subclass of *Axes*

The Axes of the subplot. The returned Axes base class depends on the projection used. It is *Axes* if rectilinear projection is used and [\*projections.polar.PolarAxes\*](#) if polar projection is used. The returned Axes is then a subplot subclass of the base class.

## Other Parameters

**\*\*kwargs**

This method also takes the keyword arguments for the returned Axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<code>Figure</code>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <code>Bbox</code>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str

continues on next

Table 139 – continued from previous page

Property	Description
<code>xlim</code>	(bottom: float, top: float)
<code>xmargin</code>	float greater than -0.5
<code>xscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>xticklabels</code>	unknown
<code>xticks</code>	unknown
<code>ybound</code>	unknown
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>yticklabels</code>	unknown
<code>yticks</code>	unknown
<code>zorder</code>	float

See also:

`Figure.add_axes`  
`pyplot.subplot`  
`pyplot.axes`  
`Figure.subplots`  
`pyplot.subplots`

## Examples

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1) # equivalent but more general

fig.add_subplot(232, frameon=False) # subplot with no frame
fig.add_subplot(233, projection='polar') # polar subplot
fig.add_subplot(234, sharex=ax1) # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red") # red subplot

ax1.remove() # delete ax1 from the figure
fig.add_subplot(ax1) # add ax1 back to the figure
```

### `align_labels(self, axs=None)`

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

#### Parameters

### axs

[list of `Axes`] Optional list (or ndarray) of `Axes` to align the labels. Default is to align all Axes on the figure.

See also:

`matplotlib.figure.Figure.align_xlabels`  
`matplotlib.figure.Figure.align_ylabels`

### `align_xlabels`(*self, axs=None*)

Align the xlabel of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on Axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on Axes with the same top-most row.

### Parameters

#### axs

[list of `Axes`] Optional list of (or ndarray) `Axes` to align the xlabel. Default is to align all Axes on the figure.

See also:

`matplotlib.figure.Figure.align_ylabels`  
`matplotlib.figure.Figure.align_labels`

### Notes

This assumes that `axs` are from the same `GridSpec`, so that their `SubplotSpec` positions correspond to figure positions.

### Examples

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

**`align_ylabels(self, axs=None)`**

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on Axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on Axes with the same right-most column.

**Parameters****axs**

[list of `Axes`] Optional list (or ndarray) of `Axes` to align the ylabels. Default is to align all Axes on the figure.

**See also:**

`matplotlib.figure.Figure.align_xlabels`  
`matplotlib.figure.Figure.align_labels`

**Notes**

This assumes that `axs` are from the same `GridSpec`, so that their `SubplotSpec` positions correspond to figure positions.

**Examples**

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

**`autofmt_xdate(self, bottom=0.2, rotation=30, ha='right', which='major')`**

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared x-axis where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabel.

**Parameters****bottom**

[float, default: 0.2] The bottom of the subplots for `subplots_adjust`.

**rotation**

[float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

**ha**

[{'left', 'center', 'right'}, default: 'right'] The horizontal alignment of the xticklabels.

**which**

[{'major', 'minor', 'both'}, default: 'major'] Selects which ticklabels to rotate.

**property axes**

The `Axes` instance the artist resides in, or `None`.

**colorbar**(*self, mappable, cax=None, ax=None, use\_gridspec=True, \*\*kw*)

Add a colorbar to a plot.

**Parameters****mappable**

The `matplotlib.cm.ScalarMappable` (i.e., `AxesImage`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure.colorbar` method but optional for the `pyplot.colorbar` function, which sets the default to the current image.

Note that one can create a `ScalarMappable` "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),  
            ax=ax)
```

**cax**

[`Axes`, optional] Axes into which the colorbar will be drawn.

**ax**

[`Axes`, list of `Axes`, optional] One or more parent axes from which space for a new colorbar axes will be stolen, if `cax` is `None`. This has no effect if `cax` is set.

**use\_gridspec**

[bool, optional] If `cax` is `None`, a new `cax` is created as an instance of `Axes`. If `ax` is an instance of `Subplot` and `use_gridspec` is `True`, `cax` is created as an instance of `Subplot` using the `gridspec` module.

**Returns****colorbar**

[`Colorbar`] See also its base class, `ColorbarBase`.

## Notes

Additional keyword arguments are of two kinds:

axes properties:

### location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

### orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

### fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

### shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

### aspect

[float, default: 20] Ratio of long to short dimensions.

### pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

### anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

### panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Property	Description
<code>extend</code>	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<code>extendfrac</code>	{ <code>None</code> , 'auto', length, lengths} If set to <code>None</code> , both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when <code>spacing</code> is set to ' <code>uniform</code> ') or the same lengths as the respective adjacent interior boxes (when <code>spacing</code> is set to ' <code>proportional</code> '). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
<code>extenderect</code>	bool If <code>False</code> the minimum and maximum colorbar extensions will be triangular (the default). If <code>True</code> the extensions will be rectangular.
<code>spacing</code>	{' <code>uniform</code> ', ' <code>proportional</code> '} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<code>ticks</code>	<code>None</code> or list of ticks or Locator If None, ticks are determined automatically from the input.
<code>format</code>	<code>None</code> or str or Formatter If None, <code>ScalarFormatter</code> is used. If a format string is given, e.g., ' <code>%.3f</code> ', that is used. An alternative <code>Formatter</code> may be given instead.
<code>drawedges</code>	bool Whether to draw lines at color boundaries.
<code>label</code>	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Property	Description
<code>boundaries</code>	<code>None</code> or a sequence
<code>values</code>	<code>None</code> or a sequence which must be of length 1 less than the sequence of <code>boundaries</code> . For each region delimited by adjacent entries in <code>boundaries</code> , the colormapped to the corresponding value in <code>values</code> will be used.

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

The `shrink` kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if `cax` is specified, it determines the size of the colorbar and `shrink` and `aspect` kwargs are

ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images ( $\alpha < 1$ ) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

#### **contains** (*self, mouseevent*)

Test whether the mouse event occurred on the figure.

#### **Returns**

**bool, {}**

#### **convert\_xunits** (*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

#### **convert\_yunits** (*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

#### **delaxes** (*self, ax*)

Remove the *Axes* *ax* from the figure; update the current Axes.

#### **draw** (*self, renderer, \*args, \*\*kwargs*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

#### **Parameters**

##### **renderer**

[*RendererBase* subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

##### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

##### `include_self`

[bool] Include *self* in the list to be checked for a match.

#### Returns

##### `list of Artist`

### `format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

##### `get_cursor_data`

### `property frameon`

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

### `gca`(*self*, `**kwargs`)

Get the current Axes, creating one if necessary.

The following kwargs are supported for ensuring the returned Axes adheres to the given projection etc., and for Axes creation if the active Axes does not exist:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<i>Figure</i>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <i>Bbox</i>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<i>Transform</i>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str
<code>xlim</code>	(bottom: float, top: float)
<code>xmargin</code>	float greater than -0.5
<code>xscale</code>	{"linear", "log", "symlog", "logit", ...} or <i>ScaleBase</i>

continues on next

Table 140 – continued from previous page

Property	Description
<code>xticklabels</code>	unknown
<code>xticks</code>	unknown
<code>ybound</code>	unknown
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>yticklabels</code>	unknown
<code>yticks</code>	unknown
<code>zorder</code>	float

**`get_agg_filter(self)`**

Return filter function to be used for agg filter.

**`get_alpha(self)`**

Return the alpha value used for blending - not supported on all backends.

**`get_animated(self)`**

Return whether the artist is animated.

**`get_children(self)`**

Get a list of artists contained in the figure.

**`get_clip_box(self)`**

Return the clipbox.

**`get_clip_on(self)`**

Return whether the artist uses clipping.

**`get_clip_path(self)`**

Return the clip path.

**`get_contains(self)`**

[Deprecated] Return the custom contains function of the artist if set, or `None`.

**See also:**

`set_contains`

## Notes

Deprecated since version 3.3.

### `get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

## Parameters

### `event`

`[matplotlib.backend_bases.MouseEvent]`

## See also:

### `format_cursor_data`

### `get_default_bbox_extra_artists(self)`

### `get_edgecolor(self)`

Get the edge color of the Figure rectangle.

### `get_facecolor(self)`

Get the face color of the Figure rectangle.

### `get_figure(self)`

Return the `Figure` instance the artist belongs to.

### `get_frameon(self)`

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

### `get_gid(self)`

Return the group id.

### `get_in_layout(self)`

Return boolean flag, True if artist is included in layout calculations.

E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_label(self)**  
Return the label used for this artist in the legend.

**get\_linewidth(self)**  
Get the line width of the Figure rectangle.

**get\_path\_effects(self)**

**get\_picker(self)**  
Return the picking behavior of the artist.

The possible values are described in [set\\_picker](#).

**See also:**

[set\\_picker](#), [pickable](#), [pick](#)

**get\_rasterized(self)**  
Return whether the artist is to be rasterized.

**get\_sketch\_params(self)**  
Return the sketch parameters for the artist.

**Returns**

**tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap(self)**  
Return the snap setting.

See [set\\_snap](#) for details.

**get\_tightbbox(self, renderer, bbox\_extra\_artists=None)**  
Return a (tight) bounding box of the figure in inches.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

**Parameters**

**renderer**

[[RendererBase](#) subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**bbox\_extra\_artists**

[list of `Artist` or `None`] List of artists to include in the tight bounding box.  
If `None` (default), then all artist children of each Axes are included in the tight bounding box.

## Returns

### `BboxBase`

containing the bounding box (in figure inches).

#### `get_transform(self)`

Return the `Transform` instance used by this artist.

#### `get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

#### `get_url(self)`

Return the url.

#### `get_visible(self)`

Return the visibility.

#### `get_window_extent(self, *args, **kwargs)`

Return the figure bounding box in display space. Arguments are ignored.

#### `get_zorder(self)`

Return the artist's zorder.

#### `have_units(self)`

Return whether units are set on any axis.

#### `is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is `True` after `set_transform` has been called.

#### `legend(self, *args, **kwargs)`

Place a legend on the figure.

Call signatures:

```
legend()
legend(labels)
legend(handles, labels)
```

The call signatures correspond to these three different ways to use this method:

#### 1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
fig.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
fig.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Figure.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

### 2. Labeling existing plot elements

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
ax1.plot([1, 3, 5], color='blue')
ax2.plot([2, 4, 6], color='red')
fig.legend(['the blues', 'the reds'])
```

Note: This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

### 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
fig.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

## Parameters

### handles

[list of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

### labels

[list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

## Returns

***Legend*****Other Parameters****loc**

[str or pair of floats, default: `rcParams["legend.loc"]`] (default: 'best') ('best' for axes, 'upper right' for figures) The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor**

[`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox\_transform*, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (*x*, *y*, *width*, *height*) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (*x*, *y*) places the corner of the legend specified by *loc* at *x*, *y*. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol**

[int, default: 1] The number of columns that the legend has.

**prop**

[None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

**fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

**labelcolor**

[str or list] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints**

[int, default: *rcParams*["legend.numpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

**scatterpoints**

[int, default: *rcParams*["legend.scatterpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

**scatteryoffsets**

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

#### **markerscale**

[float, default: `rcParams["legend.markerscale"]`] (default: 1.0)  
The relative size of legend markers compared with the originally drawn ones.

#### **markerfirst**

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

#### **frameon**

[bool, default: `rcParams["legend.frameon"]`] (default: True)  
Whether the legend should be drawn on a patch (frame).

#### **fancybox**

[bool, default: `rcParams["legend.fancybox"]`] (default: True)  
Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.

#### **shadow**

[bool, default: `rcParams["legend.shadow"]`] (default: False)  
Whether to draw a shadow behind the legend.

#### **framealpha**

[float, default: `rcParams["legend.framealpha"]`] (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

#### **facecolor**

[{"inherit" or color, default: `rcParams["legend.facecolor"]`] (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

#### **edgecolor**

[{"inherit" or color, default: `rcParams["legend.edgecolor"]`] (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

#### **mode**

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

#### **bbox\_transform**

[None or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.

**title**

[str or None] The legend's title. Default is no title (`None`).

**title\_fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: `None`)] The font size of the legend's title.

**borderpad**

[float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing**

[float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.

**handlelength**

[float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.

**handletextpad**

[float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.

**borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)] The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: `rcParams["legend.columnspacing"]` (default: 2.0)] The spacing between columns, in font-size units.

**handler\_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

**See also:**

`Axes.legend`

## Notes

Some artists are not supported by this function. See [Legend guide](#) for details.

### **property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also [get\\_cursor\\_data\(\)](#), [ToolCursorPosition](#) and [NavigationToolbar2](#).

### **pchanged(self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

[add\\_callback](#)

[remove\\_callback](#)

### **pick(self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

[set\\_picker](#), [get\\_picker](#), [pickable](#)

### **pickable(self)**

Return whether the artist is pickable.

See also:

[set\\_picker](#), [get\\_picker](#), [pick](#)

### **properties(self)**

Return a dictionary of all the properties of the artist.

### **remove(self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with [FigureCanvasBase.draw\\_idle](#). Call [relim](#) to update the axes limits if desired.

Note: [relim](#) will not see collections even if the collection was added to the axes with *autolim* = *True*.

Note: there is no support for removing the artist's legend entry.

### **remove\_callback(self, oid)**

Remove a callback based on its observer id.

See also:

**`add_callback`****`sca` (*self*, *a*)**

Set the current Axes to be *a* and return *a*.

**`set` (*self*, *\*\*kwargs*)**

A property batch setter. Pass *kwargs* to set properties.

**`set_agg_filter` (*self*, *filter\_func*)**

Set the agg filter.

**Parameters****`filter_func`**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**`set_alpha` (*self*, *alpha*)**

Set the alpha value used for blending - not supported on all backends.

**Parameters****`alpha`**

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

**`set_animated` (*self*, *b*)**

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call [\*Figure.draw\\_artist\*](#) / [\*Axes.draw\\_artist\*](#) explicitly on the artist. This approach is used to speed up animations using blitting.

See also [\*matplotlib.animation\*](#) and [\*Faster rendering by using blitting\*](#).

**Parameters****`b`**

[bool]

**`set_clip_box` (*self*, *clipbox*)**

Set the artist's clip [\*Bbox\*](#).

**Parameters****`clipbox`**

[[\*Bbox\*](#)]

**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b**

[bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters****path**

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform**

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_contains**(*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters****picker**

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴dict
```

that returns:

- a bool indicating if the event is within the artist

- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

**set\_edgecolor**(*self, color*)

Set the edge color of the Figure rectangle.

### Parameters

**color**

[color]

**set\_facecolor**(*self, color*)

Set the face color of the Figure rectangle.

### Parameters

**color**

[color]

**set\_figure**(*self, fig*)

Set the `Figure` instance the artist belongs to.

### Parameters

**fig**

[`Figure`]

**set\_frameon**(*self, b*)

Set the figure's background patch visibility, i.e. whether the figure background will be drawn.  
Equivalent to `Figure.patch.set_visible()`.

### Parameters

**b**

[bool]

**set\_gid**(*self, gid*)

Set the (group) id for the artist.

### Parameters

**gid**

[str]

**set\_in\_layout**(*self, in\_layout*)

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout**

[bool]

**set\_label**(*self, s*)

Set a label that will be displayed in the legend.

#### Parameters

**s**

[object] *s* will be converted to a string by calling `str`.

**set\_linewidth**(*self, linewidth*)

Set the line width of the Figure rectangle.

#### Parameters

**linewidth**

[number]

**set\_path\_effects**(*self, path\_effects*)

Set the path effects.

#### Parameters

**path\_effects**

[[AbstractPathEffect](#)]

**set\_picker**(*self, picker*)

Define the picking behavior of the artist.

#### Parameters

**picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### **set\_rasterized(self, rasterized)**

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

#### **Parameters**

##### **rasterized**

[bool]

### **set\_sketch\_params(self, scale=None, length=None, randomness=None)**

Set the sketch parameters.

#### **Parameters**

##### **scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

##### **length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

##### **randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

### **set\_snap(self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

### Parameters

#### **snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

### **set\_transform(self, t)**

Set the artist transform.

### Parameters

#### **t**

[*Transform*]

### **set\_url(self, url)**

Set the url for the artist.

### Parameters

#### **url**

[str]

### **set\_visible(self, b)**

Set the artist's visibility.

### Parameters

#### **b**

[bool]

### **set\_zorder(self, level)**

Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**subfigures(self, nrows=1, ncols=1, squeeze=True, wspace=None, hspace=None, width\_ratios=None, height\_ratios=None, \*\*kwargs)**

Add a subfigure to this figure or subfigure.

A subfigure has the same artist methods as a figure, and is logically the same as a figure, but cannot print itself. See /gallery/subplots\_axes\_and\_figures/subfigures.

### Parameters

**nrows, ncols**

[int, default: 1] Number of rows/columns of the subfigure grid.

**squeeze**

[bool, default: True] If True, extra dimensions are squeezed out from the returned array of subfigures.

**wspace, hspace**

[float, default: None] The amount of width/height reserved for space between subfigures, expressed as a fraction of the average subfigure width/height. If not given, the values will be inferred from a figure or rcParams when necessary.

**width\_ratios**

[array-like of length ncols, optional] Defines the relative widths of the columns. Each column gets a relative width of width\_ratios[i] / sum(width\_ratios). If not given, all columns will have the same width.

## height\_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i]` / `sum(height_ratios)`. If not given, all rows will have the same height.

```
subplot_mosaic(self, mosaic, *, subplot_kw=None, gridspec_kw=None,
                empty_sentinel='.'
```

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

---

**Note:** This API is provisional and may be revised in the future based on early user feedback.

---

## Parameters

### mosaic

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [[ 'A panel', 'A panel', 'edge'],
      [ 'C panel', '.', 'edge']]
```

Produces 4 Axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which is 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it can either be a multi-line string of the form

```
''
AAE
C.E
'''
```

where each character is a column and each line is a row. Or it can be a single-line string where rows are separated by ; :

```
'AB;CC'
```

The string notation allows only single character Axes labels and does not support nesting but is very terse.

**subplot\_kw**

[dict, optional] Dictionary with keywords passed to the [\*Figure.add\\_subplot\*](#) call used to create each subplot.

**gridspec\_kw**

[dict, optional] Dictionary with keywords passed to the [\*GridSpec\*](#) constructor used to create the grid the subplots are placed on.

**empty\_sentinel**

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to ' '. Note, if *layout* is a string, it is processed via [\*inspect.cleandoc\*](#) to remove leading white space, which may interfere with using white-space as the empty sentinel.

**Returns****dict[label, Axes]**

A dictionary mapping the labels to the Axes objects. The order of the axes is left-to-right and top-to-bottom of their position in the total layout.

**subplots** (*self*, *nrows*=1, *ncols*=1, \*, *sharex*=False, *sharey*=False, *squeeze*=True, *subplot\_kw*=None, *gridspec\_kw*=None)

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

**Parameters****nrows, ncols**

[int, default: 1] Number of rows/columns of the subplot grid.

**sharex, sharey**

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use [\*tick\\_params\*](#).

When subplots have a shared axis that has units, calling [\*Axis.set\\_units\*](#) will update each axis with the new units.

**squeeze**

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

**subplot\_kw**

[dict, optional] Dict with keywords passed to the `Figure.add_subplot` call used to create each subplot.

**gridspec\_kw**

[dict, optional] Dict with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**Returns****Axes or array of Axes**

Either a single `Axes` object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the `squeeze` keyword, see above.

**See also:**

`pypplot.subplots`

`Figure.add_subplot`

`pypplot.subplot`

**Examples**

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure()

# Create a subplot
```

(continues on next page)

(continued from previous page)

```
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar Axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(projection='polar'))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

**subplots\_adjust**(*self*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*,  
*hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"]`.

### Parameters

#### **left**

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

#### **right**

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

#### **bottom**

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

#### **top**

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

### wspace

[float, optional] The width of the padding between subplots, as a fraction of the average Axes width.

### hspace

[float, optional] The height of the padding between subplots, as a fraction of the average Axes height.

## `suptitle`(*self*, *t*, *\*\*kwargs*)

Add a centered suptitle to the figure.

### Parameters

#### **t**

[str] The suptitle text.

#### **x**

[float, default: 0.5] The x location of the text in figure coordinates.

#### **y**

[float, default: 0.98] The y location of the text in figure coordinates.

#### **horizontalalignment, ha**

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (x, y).

#### **verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: top] The vertical alignment of the text relative to (x, y).

#### **fontsize, size**

[default: `rcParams["figure.titlesize"]`] (default: 'large') The font size of the text. See `Text.set_size` for possible values.

#### **fontweight, weight**

[default: `rcParams["figure.titleweight"]`] (default: 'normal') The font weight of the text. See `Text.set_weight` for possible values.

### Returns

#### **text**

The `Text` instance of the suptitle.

### Other Parameters

**fontproperties**

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the [\*FontProperties\*](#) defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are [\*matplotlib.text.Text\*](#) properties.

**supxlabel**(*self*, *t*, **\*\*kwargs**)

Add a centered supxlabel to the figure.

**Parameters****t**

[str] The supxlabel text.

**x**

[float, default: 0.5] The x location of the text in figure coordinates.

**y**

[float, default: 0.01] The y location of the text in figure coordinates.

**horizontalalignment, ha**

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: bottom] The vertical alignment of the text relative to (x, y).

**fontsize, size**

[default: `rcParams["figure.titlesize"]` (default: 'large')] The font size of the text. See [\*Text.set\\_size\*](#) for possible values.

**fontweight, weight**

[default: `rcParams["figure.titleweight"]` (default: 'normal')] The font weight of the text. See [\*Text.set\\_weight\*](#) for possible values.

**Returns****text**

The [\*Text\*](#) instance of the sup xlabel.

**Other Parameters**

## fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the [FontProperties](#) defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

## \*\*kwargs

Additional kwargs are [matplotlib.text.Text](#) properties.

### `supylabel(self, t, **kwargs)`

Add a centered supylabel to the figure.

#### Parameters

##### `t`

[str] The sup ylabel text.

##### `x`

[float, default: 0.02] The x location of the text in figure coordinates.

##### `y`

[float, default: 0.5] The y location of the text in figure coordinates.

##### `horizontalalignment, ha`

[{'center', 'left', 'right'}, default: left] The horizontal alignment of the text relative to  $(x, y)$ .

##### `verticalalignment, va`

[{'top', 'center', 'bottom', 'baseline'}, default: center] The vertical alignment of the text relative to  $(x, y)$ .

##### `fontsize, size`

[default: `rcParams["figure.titlesize"]`] (default: 'large'))] The font size of the text. See `Text.set_size` for possible values.

##### `fontweight, weight`

[default: `rcParams["figure.titleweight"]`] (default: 'normal'))] The font weight of the text. See `Text.set_weight` for possible values.

#### Returns

##### `text`

The `Text` instance of the sup ylabel.

#### Other Parameters

**fontproperties**

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the [\*FontProperties\*](#) defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are [\*matplotlib.text.Text\*](#) properties.

**text** (*self*, *x*, *y*, *s*, *fontdict=None*, **\*\*kwargs**)

Add text to figure.

**Parameters**

**x, y**

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

**s**

[str] The text string.

**fontdict**

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

**Returns**

[\*Text\*](#)

**Other Parameters****\*\*kwargs**

[[\*Text\*](#) properties] Other miscellaneous text parameters.

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) uint8 array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <a href="#"><i>patches.FancyBboxPatch</i></a>
<code>clip_box</code>	<a href="#"><i>Bbox</i></a>
<code>clip_on</code>	bool

Table 141 – continued from pr

Property	Description
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code> or <code>family</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code> or <code>font</code> or <code>font_properties</code>	<code>font_manager.FontProperties</code> or str or <code>pathlib.Path</code>
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'normal', 'semi-condensed', 'semi-expanded', 'expanded'}
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'medium', 'semibold', 'bold', 'heavy', 'extra-heavy'}
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>math_fontfamily</code>	str
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>text</code>	object
<code>transform</code>	<code>Transform</code>
<code>transform_rotates_text</code>	bool
<code>url</code>	str
<code>usetex</code>	bool or None
<code>verticalalignment</code> or <code>va</code>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<code>visible</code>	bool
<code>wrap</code>	bool
<code>x</code>	float
<code>y</code>	float
<code>zorder</code>	float

See also:

`Axes.text`

`pyplot.text`

`update(self, props)`

Update this artist's properties from the dict *props*.

### Parameters

#### props

[dict]

#### update\_from(*self, other*)

Copy properties from *other* to *self*.

#### zorder = 0

**class** matplotlib.figure.**SubFigure**(*parent, subplotspec, \*, facecolor=None, edgecolor=None, linewidth=0.0, frameon=None*)

Logical figure that can be placed inside a figure.

Typically instantiated using *Figure.add\_subfigure* or *SubFigure.add\_subfigure*, or *SubFigure.subplots*. A subfigure has the same methods as a figure except for those particularly tied to the size or dpi of the figure, and is confined to a prescribed region of the figure. For example the following puts two subfigures side-by-side:

```
fig = plt.figure()
sfigs = fig.subfigures(1, 2)
axsL = sfigs[0].subplots(1, 2)
axsR = sfigs[1].subplots(2, 1)
```

See /gallery/subplots\_axes\_and\_figures/subfigures

### Parameters

#### parent

[*figure.Figure* or *figure.SubFigure*] Figure or subfigure that contains the SubFigure. SubFigures can be nested.

#### subplotspec

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

#### facecolor

[default: *rcParams["figure.facecolor"]* (default: 'white')] The figure patch face color.

#### edgecolor

[default: *rcParams["figure.edgecolor"]* (default: 'white')] The figure patch edge color.

#### linewidth

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

**frameon**

[bool, default: `rcParams["figure.frameon"]` (default: `True`)] If `False`, suppress drawing the figure background patch.

**`add_artist` (*self, artist, clip=False*)**

Add an `Artist` to the figure.

Usually artists are added to Axes objects using `Axes.add_artist`; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

**Parameters****artist**

[`Artist`] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transSubfigure`.

**clip**

[bool, default: `False`] Whether the added artist should be clipped by the figure patch.

**Returns****`Artist`**

The added artist.

**`add_axes` (*self, \*args, \*\*kwargs*)**

Add an Axes to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

**Parameters****rect**

[sequence of float] The dimensions [left, bottom, width, height] of the new Axes. All quantities are in fractions of figure width and height.

**projection**

[{`None`, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the `Axes`. `str` is the name of a custom projection, see `projections`. The default `None` results in a 'rectilinear' projection.

**polar**

[bool, default: `False`] If `True`, equivalent to `projection='polar'`.

**axes\_class**

[subclass type of `Axes`, optional] The `axes.Axes` subclass that is instantiated. This parameter is incompatible with `projection` and `polar`. See `axisartist` for examples.

**sharex, sharey**

[`Axes`, optional] Share the x or y `axis` with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label**

[str] A label for the returned Axes.

**Returns****`Axes`, or a subclass of `Axes`**

The returned axes class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used.

**Other Parameters****\*\*kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown

<code>yticks</code>	unknown
<code>zorder</code>	float

See also:

`Figure.add_subplot`  
`pyplot.subplot`  
`pyplot.axes`  
`Figure.subplots`

***pyplot.subplots*****Notes**

In rare circumstances, `add_axes` may be called with a single argument, an Axes instance already created in the present figure but not in the figure's list of Axes.

**Examples**

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

**`add_callback(self, func)`**

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

**Parameters****func**

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns****int**

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

See also:

**`remove_callback`****`add_gridspec(self, nrows=1, ncols=1, **kwargs)`**

Return a `GridSpec` that has this figure as a parent. This allows complex layout of Axes in the figure.

**Parameters**

**nrows**

[int, default: 1] Number of rows in grid.

**ncols**

[int, default: 1] Number or columns in grid.

**Returns**

*GridSpec*

**Other Parameters****\*\*kwargs**

Keyword arguments are passed to *GridSpec*.

**See also:**

`matplotlib.pyplot.subplots`

**Examples**

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

**add\_subfigure(self, subplotspec, \*\*kwargs)**

Add a *SubFigure* to the figure as part of a subplot arrangement.

**Parameters****subplotspec**

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

**Returns**

*figure.SubFigure*

**Other Parameters**

**\*\*kwargs**

Are passed to the [SubFigure](#) object.

**See also:**[\*\*Figure.subfigures\*\*](#)[\*\*add\\_subplot\*\*\(self, \\*args, \\*\\*kwargs\)](#)

Add an [Axes](#) to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

**Parameters****\*args**

[int, (int, int, *index*), or [SubplotSpec](#), default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A [SubplotSpec](#).

In rare circumstances, `add_subplot` may be called with a single argument, a subplot [Axes](#) instance already created in the present figure but not in the figure's list of [Axes](#).

**projection**

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot ([Axes](#)). *str* is the name of a custom projection, see [projections](#). The default None results in a 'rectilinear' projection.

**polar**

[bool, default: False] If True, equivalent to `projection='polar'`.

**axes\_class**

[subclass type of `Axes`, optional] The `axes.Axes` subclass that is instantiated. This parameter is incompatible with `projection` and `polar`. See `axisartist` for examples.

**sharex, sharey**

[`Axes`, optional] Share the x or y `axis` with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label**

[str] A label for the returned Axes.

**Returns****`axes.SubplotBase`, or another subclass of `Axes`**

The Axes of the subplot. The returned Axes base class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used. The returned Axes is then a subplot subclass of the base class.

**Other Parameters****\*\*kwargs**

This method also takes the keyword arguments for the returned Axes base class; except for the `figure` argument. The keyword arguments for the rectilinear base class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None

continues on next

Table 143 – continued from previous page

Property	Description
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<code>Figure</code>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <code>Bbox</code>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<code>Transform</code>
<code>url</code>	str

<code>zorder</code>	float

See also:

`Figure.add_axes`

`pyplot.subplot`

`pyplot.axes`

`Figure.subplots`

**`pypplot.subplots`****Examples**

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1) # equivalent but more general

fig.add_subplot(232, frameon=False) # subplot with no frame
fig.add_subplot(233, projection='polar') # polar subplot
fig.add_subplot(234, sharex=ax1) # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red") # red subplot

ax1.remove() # delete ax1 from the figure
fig.add_subplot(ax1) # add ax1 back to the figure
```

**`align_labels(self, axs=None)`**

Align the xlabel and ylabel of subplots with the same subplot row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

**Parameters****axs**

[list of `Axes`] Optional list (or ndarray) of `Axes` to align the labels. Default is to align all Axes on the figure.

**See also:**

`matplotlib.figure.Figure.align_xlabels`

`matplotlib.figure.Figure.align_ylabels`

**`align_xlabels(self, axs=None)`**

Align the xlabel of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on Axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on Axes with the same top-most row.

**Parameters****axs**

[list of `Axes`] Optional list of (or ndarray) `Axes` to align the xlabel. Default is to align all Axes on the figure.

**See also:**

`matplotlib.figure.Figure.align\_ylabels`

`matplotlib.figure.Figure.align\_labels`

## Notes

This assumes that `axs` are from the same `GridSpec`, so that their `SubplotSpec` positions correspond to figure positions.

## Examples

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

### `align\_ylabels\(self, axes=None\)`

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on Axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on Axes with the same right-most column.

### Parameters

#### `axes`

[list of `Axes`] Optional list (or ndarray) of `Axes` to align the ylabels. Default is to align all Axes on the figure.

**See also:**

`matplotlib.figure.Figure.align\_xlabels`

`matplotlib.figure.Figure.align\_labels`

## Notes

This assumes that `axs` are from the same `GridSpec`, so that their `SubplotSpec` positions correspond to figure positions.

## Examples

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

### `autofmt_xdate` (*self*, *bottom*=0.2, *rotation*=30, *ha*='right', *which*='major')

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared x-axis where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabel.

#### Parameters

##### `bottom`

[float, default: 0.2] The bottom of the subplots for `subplots_adjust`.

##### `rotation`

[float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

##### `ha`

[{'left', 'center', 'right'}, default: 'right'] The horizontal alignment of the xticklabels.

##### `which`

[{'major', 'minor', 'both'}, default: 'major'] Selects which ticklabels to rotate.

### `property axes`

List of Axes in the SubFigure. You can access and modify the Axes in the SubFigure through this list.

Do not modify the list itself. Instead, use `add_axes`, `add_subplot` or `delaxes` to add or remove an Axes.

### `colorbar` (*self*, *mappable*, *cax*=*None*, *ax*=*None*, *use\_gridspec*=*True*, *\*\*kw*)

Add a colorbar to a plot.

#### Parameters

**mappable**

The `matplotlib.cm.ScalarMappable` (i.e., `AxesImage`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure.colorbar` method but optional for the `pyplot.colorbar` function, which sets the default to the current image.

Note that one can create a `ScalarMappable` "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),  
            ax=ax)
```

**cax**

[`Axes`, optional] Axes into which the colorbar will be drawn.

**ax**

[`Axes`, list of `Axes`, optional] One or more parent axes from which space for a new colorbar axes will be stolen, if `cax` is `None`. This has no effect if `cax` is set.

**use\_gridspec**

[bool, optional] If `cax` is `None`, a new `cax` is created as an instance of `Axes`. If `ax` is an instance of `Subplot` and `use_gridspec` is `True`, `cax` is created as an instance of `Subplot` using the `gridspec` module.

**Returns****colorbar**

[`Colorbar`] See also its base class, `ColorbarBase`.

**Notes**

Additional keyword arguments are of two kinds:

axes properties:

**location**

[`None` or `{'left', 'right', 'top', 'bottom'}`] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If `None`, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

**orientation**

[`None` or `{'vertical', 'horizontal'}`] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the

*orientation*; passing incompatible values for *location* and *orientation* raises an exception.

**fraction**

[float, default: 0.15] Fraction of original axes to use for colorbar.

**shrink**

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

**aspect**

[float, default: 20] Ratio of long to short dimensions.

**pad**

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor**

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor**

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Property	Description
<code>extend</code>	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<code>extendfrac</code>	{ <code>None</code> , 'auto', length, lengths} If set to <code>None</code> , both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when <code>spacing</code> is set to ' <code>uniform</code> ') or the same lengths as the respective adjacent interior boxes (when <code>spacing</code> is set to ' <code>proportional</code> '). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
<code>extenderect</code>	bool If <code>False</code> the minimum and maximum colorbar extensions will be triangular (the default). If <code>True</code> the extensions will be rectangular.
<code>spacing</code>	{' <code>uniform</code> ', ' <code>proportional</code> '} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<code>ticks</code>	<code>None</code> or list of ticks or Locator If <code>None</code> , ticks are determined automatically from the input.
<code>format</code>	<code>None</code> or str or Formatter If <code>None</code> , <code>ScalarFormatter</code> is used. If a format string is given, e.g., ' <code>%3f</code> ', that is used. An alternative <code>Formatter</code> may be given instead.
<code>drawedges</code>	bool Whether to draw lines at color boundaries.
<code>label</code>	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Property	Description
<code>boundaries</code>	<code>None</code> or a sequence
<code>values</code>	<code>None</code> or a sequence which must be of length 1 less than the sequence of <code>boundaries</code> . For each region delimited by adjacent entries in <code>boundaries</code> , the colormapped to the corresponding value in <code>values</code> will be used.

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

The `shrink` kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if `cax` is specified, it determines the size of the colorbar and `shrink` and `aspect` kwargs are

ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images ( $\alpha < 1$ ) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

### **contains** (*self, mouseevent*)

Test whether the mouse event occurred on the figure.

#### **Returns**

**bool, {}**

### **convert\_xunits** (*self, x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

### **convert\_yunits** (*self, y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

### **delaxes** (*self, ax*)

Remove the *Axes* *ax* from the figure; update the current Axes.

### **draw** (*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

#### **Parameters**

##### **renderer**

[*RendererBase* subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `findobj`(*self*, *match=None*, *include\_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

##### `match`

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

##### `include_self`

[bool] Include *self* in the list to be checked for a match.

#### Returns

##### `list of Artist`

### `format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

##### `get_cursor_data`

### `property frameon`

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

### `gca`(*self*, `**kwargs`)

Get the current Axes, creating one if necessary.

The following kwargs are supported for ensuring the returned Axes adheres to the given projection etc., and for Axes creation if the active Axes does not exist:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<i>Figure</i>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <i>Bbox</i>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<i>Transform</i>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str
<code>xlim</code>	(bottom: float, top: float)
<code>xmargin</code>	float greater than -0.5
<code>xscale</code>	{"linear", "log", "symlog", "logit", ...} or <i>ScaleBase</i>

continues on next

Table 144 – continued from previous page

Property	Description
<code>xticklabels</code>	unknown
<code>xticks</code>	unknown
<code>ybound</code>	unknown
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>yticklabels</code>	unknown
<code>yticks</code>	unknown
<code>zorder</code>	float

**get\_agg\_filter(self)**

Return filter function to be used for agg filter.

**get\_alpha(self)**

Return the alpha value used for blending - not supported on all backends.

**get\_animated(self)**

Return whether the artist is animated.

**get\_axes(self)**

Return a list of Axes in the SubFigure. You can access and modify the Axes in the Figure through this list.

Do not modify the list itself. Instead, use `add_axes`, `add_subplot` or `delaxes` to add or remove an Axes.

Note: This is equivalent to the property `axes`.

**get\_children(self)**

Get a list of artists contained in the figure.

**get\_clip\_box(self)**

Return the clipbox.

**get\_clip\_on(self)**

Return whether the artist uses clipping.

**get\_clip\_path(self)**

Return the clip path.

**get\_constrained\_layout(self)**

Return whether constrained layout is being used.

See [Constrained Layout Guide](#).

**get\_constrained\_layout\_pads(self, relative=False)**

Get padding for `constrained_layout`.

Returns a list of `w_pad`, `h_pad` in inches and `wspace` and `hspace` as fractions of the subplot.

See [Constrained Layout Guide](#).

## Parameters

### `relative`

[bool] If `True`, then convert from inches to figure relative.

### `get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or `None`.

See also:

### `set_contains`

## Notes

Deprecated since version 3.3.

### `get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

## Parameters

### `event`

[`matplotlib.backend_bases.MouseEvent`]

See also:

### `format_cursor_data`

### `get_default_bbox_extra_artists(self)`

### `get_edgecolor(self)`

Get the edge color of the Figure rectangle.

### `get_facecolor(self)`

Get the face color of the Figure rectangle.

**get\_figure(self)**

Return the *Figure* instance the artist belongs to.

**get\_frameon(self)**

Return the figure's background patch visibility, i.e. whether the figure background will be drawn.  
Equivalent to `Figure.patch.get_visible()`.

**get\_gid(self)**

Return the group id.

**get\_in\_layout(self)**

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**get\_label(self)**

Return the label used for this artist in the legend.

**get\_linewidth(self)**

Get the line width of the Figure rectangle.

**get\_path\_effects(self)****get\_picker(self)**

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`

**get\_rasterized(self)**

Return whether the artist is to be rasterized.

**get\_sketch\_params(self)**

Return the sketch parameters for the artist.

**Returns****tuple or None**

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

**get\_snap(self)**

Return the snap setting.

See `set_snap` for details.

**get\_tightbbox**(*self, renderer, bbox\_extra\_artists=None*)

Return a (tight) bounding box of the figure in inches.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

**Parameters****renderer**

[`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**bbox\_extra\_artists**

[list of `Artist` or None] List of artists to include in the tight bounding box. If None (default), then all artist children of each Axes are included in the tight bounding box.

**Returns****BboxBase**

containing the bounding box (in figure inches).

**get\_transform**(*self*)

Return the `Transform` instance used by this artist.

**get\_transformed\_clip\_path\_and\_affine**(*self*)

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**get\_url**(*self*)

Return the url.

**get\_visible**(*self*)

Return the visibility.

**get\_window\_extent**(*self, \*args, \*\*kwargs*)

Return the figure bounding box in display space. Arguments are ignored.

**get\_zorder**(*self*)

Return the artist's zorder.

**have\_units**(*self*)

Return whether units are set on any axis.

**init\_layoutgrid**(*self*)

Initialize the layoutgrid for use in constrained\_layout.

**is\_transform\_set**(*self*)

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

`legend(self, *args, **kwargs)`

Place a legend on the figure.

Call signatures:

```
legend()  
legend(labels)  
legend(handles, labels)
```

The call signatures correspond to these three different ways to use this method:

### 1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')  
fig.legend()
```

or:

```
line, = ax.plot([1, 2, 3])  
line.set_label('Label via method')  
fig.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Figure.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

### 2. Labeling existing plot elements

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)  
ax1.plot([1, 3, 5], color='blue')  
ax2.plot([2, 4, 6], color='red')  
fig.legend(['the blues', 'the reds'])
```

Note: This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

### 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
fig.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

## Parameters

## handles

[list of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

## labels

[list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

## Returns

### `Legend`

## Other Parameters

### loc

[str or pair of floats, default: `rcParams["legend.loc"]`] (default: 'best') ('best' for axes, 'upper right' for figures) The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor**

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox\_transform*, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (*x*, *y*, *width*, *height*) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (*x*, *y*) places the corner of the legend specified by *loc* at *x*, *y*. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol**

[int, default: 1] The number of columns that the legend has.

**prop**

[None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font

size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

### labelcolor

[str or list] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

### numpoints

[int, default: `rcParams["legend.numpoints"]`] (default: 1) The number of marker points in the legend when creating a legend entry for a `Line2D` (line).

### scatterpoints

[int, default: `rcParams["legend.scatterpoints"]`] (default: 1) The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot).

### scatteryoffsets

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

### markerscale

[float, default: `rcParams["legend.markerscale"]`] (default: 1.0) The relative size of legend markers compared with the originally drawn ones.

### markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

### frameon

[bool, default: `rcParams["legend.frameon"]`] (default: True)] Whether the legend should be drawn on a patch (frame).

### fancybox

[bool, default: `rcParams["legend.fancybox"]`] (default: True)] Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.

### shadow

[bool, default: `rcParams["legend.shadow"]`] (default: False)] Whether to draw a shadow behind the legend.

### framealpha

[float, default: `rcParams["legend.framealpha"]`] (default: 0.8)] The alpha transparency of the legend's background. If `shadow` is activated and `framealpha` is `None`, the default value is ignored.

**facecolor**

[`"inherit"` or color, default: `rcParams["legend.facecolor"]`] (default: '`inherit`')] The legend's background color. If "`inherit`", use `rcParams["axes.facecolor"]` (default: '`white`').

**edgecolor**

[`"inherit"` or color, default: `rcParams["legend.edgecolor"]`] (default: '`0.8`')] The legend's background patch edge color. If "`inherit`", use take `rcParams["axes.edgecolor"]` (default: '`black`').

**mode**

[{"`expand`", `None`}] If `mode` is set to "`expand`" the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend's size).

**bbox\_transform**

[`None` or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.

**title**

[str or `None`] The legend's title. Default is no title (`None`).

**title\_fontsize**

[int or {'`xx-small`', '`x-small`', '`small`', '`medium`', '`large`', '`x-large`', '`xx-large`'}, default: `rcParams["legend.title_fontsize"]`] (default: `None`)] The font size of the legend's title.

**borderpad**

[float, default: `rcParams["legend.borderpad"]`] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing**

[float, default: `rcParams["legend.labelspacing"]`] (default: 0.5)] The vertical space between the legend entries, in font-size units.

**handlelength**

[float, default: `rcParams["legend.handlelength"]`] (default: 2.0)] The length of the legend handles, in font-size units.

**handletextpad**

[float, default: `rcParams["legend.handletextpad"]`] (default: 0.8)] The pad between the legend handle and text, in font-size units.

**borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)]  
The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: `rcParams["legend.columnspacing"]` (default: 2.0)]  
The spacing between columns, in font-size units.

**handler\_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

See also:

`Axes.legend`

**Notes**

Some artists are not supported by this function. See `Legend guide` for details.

**property mouseover**

If this property is set to `True`, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged(self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

**pick(self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

See also:

`set_picker`, `get_picker`, `pickable`

**pickable(self)**

Return whether the artist is pickable.

See also:

**`set_picker, get_picker, pick`****`properties(self)`**

Return a dictionary of all the properties of the artist.

**`remove(self)`**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**`remove_callback(self, oid)`**

Remove a callback based on its observer id.

**See also:**

**`add_callback`****`sca(self, a)`**

Set the current Axes to be *a* and return *a*.

**`set(self, **kwargs)`**

A property batch setter. Pass *kwargs* to set properties.

**`set_agg_filter(self, filter_func)`**

Set the agg filter.

**Parameters****`filter_func`**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**`set_alpha(self, alpha)`**

Set the alpha value used for blending - not supported on all backends.

**Parameters****`alpha`**

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

**`set_animated(self, b)`**

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call `Figure.draw_artist / Axes.draw_artist` explicitly on the artist. This approach is used to speed up animations using blitting.

See also `matplotlib.animation` and *Faster rendering by using blitting*.

### Parameters

#### b

[bool]

#### `set_clip_box(self, clipbox)`

Set the artist's clip `Bbox`.

### Parameters

#### clipbox

[`Bbox`]

#### `set_clip_on(self, b)`

Set whether the artist uses clipping.

When `False` artists will be visible outside of the axes which can lead to unexpected results.

### Parameters

#### b

[bool]

#### `set_clip_path(self, path, transform=None)`

Set the artist's clip path.

### Parameters

#### path

[`Patch` or `Path` or `TransformedPath` or `None`] The clip path. If given a `Path`, `transform` must be provided as well. If `None`, a previously set clip path is removed.

#### transform

[`Transform`, optional] Only used if `path` is a `Path`, in which case the given `Path` is converted to a `TransformedPath` using `transform`.

## Notes

For efficiency, if *path* is a `Rectangle` this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

### `set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

#### Parameters

##### **picker**

[callable] A custom picker function to evaluate if an event is within the artist.

The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, ↴dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

### `set_edgecolor(self, color)`

Set the edge color of the Figure rectangle.

#### Parameters

##### **color**

[color]

### `set_facecolor(self, color)`

Set the face color of the Figure rectangle.

#### Parameters

##### **color**

[color]

**set\_figure**(*self, fig*)

Set the [Figure](#) instance the artist belongs to.

**Parameters****fig**

[[Figure](#)]

**set\_frameon**(*self, b*)

Set the figure's background patch visibility, i.e. whether the figure background will be drawn.  
Equivalent to `Figure.patch.set_visible()`.

**Parameters****b**

[bool]

**set\_gid**(*self, gid*)

Set the (group) id for the artist.

**Parameters****gid**

[str]

**set\_in\_layout**(*self, in\_layout*)

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters****in\_layout**

[bool]

**set\_label**(*self, s*)

Set a label that will be displayed in the legend.

**Parameters****s**

[object] *s* will be converted to a string by calling `str`.

**set\_linewidth**(*self, linewidth*)

Set the line width of the Figure rectangle.

**Parameters**

**linewidth**

[number]

**set\_path\_effects**(*self, path\_effects*)

Set the path effects.

**Parameters****path\_effects**

[*AbstractPathEffect*]

**set\_picker**(*self, picker*)

Define the picking behavior of the artist.

**Parameters****picker**

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set\_rasterized**(*self, rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also /gallery/misc/rasterization\_demo.

**Parameters**

**rasterized**

[bool]

**set\_sketch\_params (self, scale=None, length=None, randomness=None)**

Set the sketch parameters.

**Parameters****scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set\_snap (self, snap)**

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap**

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set\_transform (self, t)**

Set the artist transform.

**Parameters****t**

[*Transform*]

**set\_url**(*self, url*)

Set the url for the artist.

**Parameters****url**

[str]

**set\_visible**(*self, b*)

Set the artist's visibility.

**Parameters****b**

[bool]

**set\_zorder**(*self, level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level**

[float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**subfigures**(*self, nrows=1, ncols=1, squeeze=True, wspace=None, hspace=None, width\_ratios=None, height\_ratios=None, \*\*kwargs*)

Add a subfigure to this figure or subfigure.

A subfigure has the same artist methods as a figure, and is logically the same as a figure, but cannot print itself. See /gallery/subplots\_axes\_and\_figures/subfigures.

## Parameters

### **nrows, ncols**

[int, default: 1] Number of rows/columns of the subfigure grid.

### **squeeze**

[bool, default: True] If True, extra dimensions are squeezed out from the returned array of subfigures.

### **wspace, hspace**

[float, default: None] The amount of width/height reserved for space between subfigures, expressed as a fraction of the average subfigure width/height. If not given, the values will be inferred from a figure or rcParams when necessary.

### **width\_ratios**

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

### **height\_ratios**

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

---

**subplot\_mosaic**(*self*, *mosaic*, \*, *subplot\_kw=None*, *gridspec\_kw=None*, *empty\_sentinel='.'*)

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

---

**Note:** This API is provisional and may be revised in the future based on early user feedback.

## Parameters

### **mosaic**

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [[ 'A panel', 'A panel', 'edge'],
      [ 'C panel', '.', 'edge']]
```

Produces 4 Axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which is 1 row and 1 column wide in the bottom left

- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it can either be a multi-line string of the form

```
'''  
AAE  
C.E  
'''
```

where each character is a column and each line is a row. Or it can be a single-line string where rows are separated by ;:

```
'AB;CC'
```

The string notation allows only single character Axes labels and does not support nesting but is very terse.

### **subplot\_kw**

[dict, optional] Dictionary with keywords passed to the `Figure.add_subplot` call used to create each subplot.

### **gridspec\_kw**

[dict, optional] Dictionary with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

### **empty\_sentinel**

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to ' . '. Note, if `layout` is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

## **Returns**

### **dict[label, Axes]**

A dictionary mapping the labels to the Axes objects. The order of the axes is left-to-right and top-to-bottom of their position in the total layout.

**subplots** (*self*, *nrows=1*, *ncols=1*, \*, *sharex=False*, *sharey=False*, *squeeze=True*, *subplot\_kw=None*, *gridspec\_kw=None*)

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

## **Parameters**

### **nrows, ncols**

[int, default: 1] Number of rows/columns of the subplot grid.

**sharex, sharey**

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use [tick\\_params](#).

When subplots have a shared axis that has units, calling [\*Axis.set\\_units\*](#) will update each axis with the new units.

**squeeze**

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

**subplot\_kw**

[dict, optional] Dict with keywords passed to the [\*Figure.add\\_subplot\*](#) call used to create each subplot.

**gridspec\_kw**

[dict, optional] Dict with keywords passed to the [\*GridSpec\*](#) constructor used to create the grid the subplots are placed on.

**Returns****Axes or array of Axes**

Either a single [\*Axes\*](#) object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the *squeeze* keyword, see above.

**See also:**

`pyplot.subplots`  
`Figure.add_subplot`  
`pyplot.subplot`

## Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar Axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(projection='polar'))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

**subplots\_adjust** (*self*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*,  
*hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"]`.

### Parameters

**left**

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

**right**

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

**bottom**

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

**top**

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

**wspace**

[float, optional] The width of the padding between subplots, as a fraction of the average Axes width.

**hspace**

[float, optional] The height of the padding between subplots, as a fraction of the average Axes height.

**suptitle**(*self*, *t*, *\*\*kwargs*)

Add a centered suptitle to the figure.

**Parameters****t**

[str] The suptitle text.

**x**

[float, default: 0.5] The x location of the text in figure coordinates.

**y**

[float, default: 0.98] The y location of the text in figure coordinates.

**horizontalalignment, ha**

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

**verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: top] The vertical alignment of the text relative to (*x*, *y*).

**fontsize, size**

[default: `rcParams["figure.titlesize"]`] (default: 'large')] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight**

[default: `rcParams["figure.titleweight"]` (default: 'normal')]  
The font weight of the text. See `Text.set_weight` for possible values.

**Returns****text**

The `Text` instance of the suptitle.

**Other Parameters****fontproperties**

[None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

**supxlabel**(self, t, \*\*kwargs)

Add a centered sup xlabel to the figure.

**Parameters****t**

[str] The sup xlabel text.

**x**

[float, default: 0.5] The x location of the text in figure coordinates.

**y**

[float, default: 0.01] The y location of the text in figure coordinates.

**horizontalalignment, ha**

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: bottom] The vertical alignment of the text relative to (x, y).

**fontsize, size**

[default: `rcParams["figure.titlesize"]` (default: 'large')] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight**

[default: `rcParams["figure.titleweight"]` (default: 'normal')]  
The font weight of the text. See `Text.set_weight` for possible values.

**Returns****text**

The `Text` instance of the supxlabel.

**Other Parameters****fontproperties**

[None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

**supylabel**(self, t, \*\*kwargs)

Add a centered supylabel to the figure.

**Parameters****t**

[str] The supylabel text.

**x**

[float, default: 0.02] The x location of the text in figure coordinates.

**y**

[float, default: 0.5] The y location of the text in figure coordinates.

**horizontalalignment, ha**

[{'center', 'left', 'right'}, default: left] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va**

[{'top', 'center', 'bottom', 'baseline'}, default: center] The vertical alignment of the text relative to (x, y).

**fontsize, size**

[default: `rcParams["figure.titlesize"]` (default: 'large')] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight**

[default: `rcParams["figure.titleweight"]` (default: 'normal')]  
The font weight of the text. See `Text.set_weight` for possible values.

**Returns****text**

The `Text` instance of the supylabel.

**Other Parameters****fontproperties**

[None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

**\*\*kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

**text** (*self, x, y, s, fontdict=None, \*\*kwargs*)

Add text to figure.

**Parameters****x, y**

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the `transform` keyword.

**s**

[str] The text string.

**fontdict**

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as `kwargs` override the corresponding ones given in `fontdict`.

**Returns****Text****Other Parameters**

**\*\*kwargs**

[[Text](#) properties] Other miscellaneous text parameters.

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a dpi value, and returns a filtered version of the array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <a href="#">patches.FancyBboxPatch</a>
<code>clip_box</code>	<a href="#">Bbox</a>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>figure</code>	<a href="#">Figure</a>
<code>fontfamily</code> or <code>family</code>	{'FONTPNAME', 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code> or <code>font</code> or <code>font_properties</code>	<a href="#">font_manager.FontProperties</a> or str or <a href="#">pathlib.Path</a>
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'normal'}
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'bold'}
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>math_fontfamily</code>	str
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<a href="#">AbstractPathEffect</a>
<code>picker</code>	None or bool or float or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>text</code>	object
<code>transform</code>	<a href="#">Transform</a>
<code>transform_rotates_text</code>	bool
<code>url</code>	str
<code>usetex</code>	bool or None
<code>verticalalignment</code> or <code>va</code>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<code>visible</code>	bool
<code>wrap</code>	bool

Table 145 – continued from pr

Property	Description
<code>x</code>	float
<code>y</code>	float
<code>zorder</code>	float

See also:

`Axes.text`

`pyplot.text`

`update(self, props)`

Update this artist's properties from the dict `props`.

#### Parameters

`props`

[dict]

`update_from(self, other)`

Copy properties from `other` to `self`.

`zorder = 0`

`class matplotlib.figure.SubplotParams(left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)`

A class to hold the parameters for a subplot.

Defaults are given by `rcParams["figure.subplot.[name]"]`.

#### Parameters

`left`

[float] The position of the left edge of the subplots, as a fraction of the figure width.

`right`

[float] The position of the right edge of the subplots, as a fraction of the figure width.

`bottom`

[float] The position of the bottom edge of the subplots, as a fraction of the figure height.

`top`

[float] The position of the top edge of the subplots, as a fraction of the figure height.

`wspace`

[float] The width of the padding between subplots, as a fraction of the average Axes width.

### hspace

[float] The height of the padding between subplots, as a fraction of the average Axes height.

**update**(*self*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Update the dimensions of the passed parameters. *None* means unchanged.

`matplotlib.figure.figaspect(arg)`

Calculate the width and height for a figure with a specified aspect ratio.

While the height is taken from `rcParams["figure.figsize"]` (default: [6.4, 4.8]), the width is adjusted to match the desired aspect ratio. Additionally, it is ensured that the width is in the range [4., 16.] and the height is in the range [2., 16.]. If necessary, the default height is adjusted to ensure this.

### Parameters

#### arg

[float or 2D array] If a float, this defines the aspect ratio (i.e. the ratio height / width). In case of an array the aspect ratio is number of rows / number of columns, so that the array could be fitted in the figure undistorted.

### Returns

#### width, height

[float] The figure size in inches.

### Notes

If you want to create an Axes within the figure, that still preserves the aspect ratio, be sure to create it with equal width and height. See examples below.

Thanks to Fernando Perez for this function.

### Examples

Make a figure twice as tall as it is wide:

```
w, h = figaspect(2.)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Make a figure with the proper aspect for an array:

```
A = rand(5, 3)
w, h = figaspect(A)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

## 18.25 matplotlib.font\_manager

A module for finding, managing, and using fonts across platforms.

This module provides a single `FontManager` instance that can be shared across backends and platforms. The `findfont` function returns the best TrueType (TTF) font file in the local or system font path that matches the specified `FontProperties` instance. The `FontManager` also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend.

The design is based on the [W3C Cascading Style Sheet, Level 1 \(CSS1\)](#) font specification. Future versions may implement the Level 2 or 2.1 specifications.

```
class matplotlib.font_manager.FontEntry(fname='', name='', style='normal',
                                         variant='normal', weight='normal',
                                         stretch='normal', size='medium')
```

Bases: `object`

A class for storing Font properties. It is used when populating the font lookup dictionary.

```
class matplotlib.font_manager.FontManager(size=None, weight='normal')
```

Bases: `object`

On import, the `FontManager` singleton instance creates a list of ttf and afm fonts and caches their `FontProperties`. The `FontManager.findfont` method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, the default font is returned.

```
addfont(self, path)
```

Cache the properties of the font at `path` to make it available to the `FontManager`. The type of font is inferred from the path suffix.

### Parameters

`path`

[str or path-like]

`property defaultFont`

```
findfont(self, prop, fontext='ttf', directory=None, fallback_to_default=True, re-
         build_if_missing=True)
```

Find a font that most closely matches the given font properties.

### Parameters

**prop**

[str or *FontProperties*] The font properties to search for. This can be either a *FontProperties* object or a string defining a `fontconfig` patterns.

**fontext**

[{'ttf', 'afm'}, default: 'ttf'] The extension of the font file:

- 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
- 'afm': Adobe Font Metrics (.afm)

**directory**

[str, optional] If given, only search this directory and its subdirectories.

**fallback\_to\_default**

[bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

**rebuild\_if\_missing**

[bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

**Returns****str**

The filename of the best matching font.

**Notes**

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the [W3C Cascading Style Sheet, Level 1](#) documentation for a description of the font finding algorithm.

**static get\_default\_size()**

Return the default font size.

**get\_default\_weight(*self*)**

Return the default font weight.

**score\_family(*self, families, family2*)**

Return a match score between the list of font families in *families* and the font family name *family2*.

An exact match at the head of the list returns 0.0.

A match further down the list will return between 0 and 1.

No match will return 1.0.

**score\_size**(*self*, *size1*, *size2*)

Return a match score between *size1* and *size2*.

If *size2* (the size specified in the font file) is 'scalable', this function always returns 0.0, since any font size can be generated.

Otherwise, the result is the absolute distance between *size1* and *size2*, normalized so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

**score\_stretch**(*self*, *stretch1*, *stretch2*)

Return a match score between *stretch1* and *stretch2*.

The result is the absolute value of the difference between the CSS numeric values of *stretch1* and *stretch2*, normalized between 0.0 and 1.0.

**score\_style**(*self*, *style1*, *style2*)

Return a match score between *style1* and *style2*.

An exact match returns 0.0.

A match between 'italic' and 'oblique' returns 0.1.

No match returns 1.0.

**score\_variant**(*self*, *variant1*, *variant2*)

Return a match score between *variant1* and *variant2*.

An exact match returns 0.0, otherwise 1.0.

**score\_weight**(*self*, *weight1*, *weight2*)

Return a match score between *weight1* and *weight2*.

The result is 0.0 if both *weight1* and *weight2* are given as strings and have the same value.

Otherwise, the result is the absolute value of the difference between the CSS numeric values of *weight1* and *weight2*, normalized between 0.05 and 1.0.

**set\_default\_weight**(*self*, *weight*)

Set the default font weight. The initial value is 'normal'.

```
class matplotlib.font_manager.FontProperties(family=None, style=None,
                                             variant=None,
                                             weight=None, stretch=None,
                                             size=None, fname=None,
                                             math_fontfamily=None)
```

Bases: `object`

A class for storing and manipulating font properties.

The font properties are the six properties described in the [W3C Cascading Style Sheet, Level 1](#) font specification and *math\_fontfamily* for math fonts:

- family: A list of font names in decreasing order of priority. The items may include a generic font family name, either 'sans-serif' (default), 'serif', 'cursive', 'fantasy', or 'monospace'. In that case, the actual font to be used will be looked up from the associated rcParam.
- style: Either 'normal' (default), 'italic' or 'oblique'.
- variant: Either 'normal' (default) or 'small-caps'.
- stretch: A numeric value in the range 0-1000 or one of 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal' (default), 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded'.
- weight: A numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal' (default), 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'.
- size: Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 10 (default).
- math\_fontfamily: The family of fonts used to render math text; overrides `rcParams["mathtext.fontset"]` (default: '`dejavusans`'). Supported values are the same as the ones supported by `rcParams["mathtext.fontset"]` (default: '`dejavusans`')': 'dejavusans', 'dejavuserif', 'cm', 'stix', 'stixsans' and 'custom'.

Alternatively, a font may be specified using the absolute path to a font file, by using the `fname` kwarg. However, in this case, it is typically simpler to just pass the path (as a `pathlib.Path`, not a `str`) to the `font` kwarg of the `Text` object.

The preferred usage of font sizes is to use the relative values, e.g., 'large', instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager's default font size.

This class will also accept a `fontconfig pattern`, if it is the only argument provided. This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

Note that Matplotlib's internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in Matplotlib than in other applications that use fontconfig.

### `copy(self)`

Return a copy of self.

### `get_family(self)`

Return a list of font names that comprise the font family.

### `get_file(self)`

Return the filename of the associated font.

### `get_fontconfig_pattern(self)`

Get a `fontconfig pattern` suitable for looking up the font as specified with fontconfig's `fc-match` utility.

This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

### `get_math_fontfamily(self)`

Return the name of the font family used for math text.

The default font is `rcParams["mathtext.fontset"]` (default: 'dejavusans').

**get\_name(self)**

Return the name of the font that best matches the font properties.

**get\_size(self)**

Return the font size.

**get\_size\_in\_points(self)****get\_slant(self)**

Return the font style. Values are: 'normal', 'italic' or 'oblique'.

**get\_stretch(self)**

Return the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'.

**get\_style(self)**

Return the font style. Values are: 'normal', 'italic' or 'oblique'.

**get\_variant(self)**

Return the font variant. Values are: 'normal' or 'small-caps'.

**get\_weight(self)**

Set the font weight. Options are: A numeric value in the range 0-1000 or one of 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

**set\_family(self, family)**

Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `rcParams["text.usetex"]` (default: False) is `True`.

**set\_file(self, file)**

Set the filename of the fontfile to use. In this case, all other properties will be ignored.

**set\_fontconfig\_pattern(self, pattern)**

Set the properties by parsing a `fontconfig pattern`.

This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

**set\_math\_fontfamily(self, fontfamily)**

Set the font family for text in math mode.

If not set explicitly, `rcParams["mathtext.fontset"]` (default: 'dejavusans') will be used.

## Parameters

**fontfamily**

[str] The name of the font family.

Available font families are defined in the `matplotlibrc.template` file [here](#)

See also:

`text.Text.get_math_fontfamily`

`set_name(self, family)`

Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `rcParams["text.usetex"]` (default: False) is `True`.

`set_size(self, size)`

Set the font size. Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

`set_slant(self, style)`

Set the font style. Values are: 'normal', 'italic' or 'oblique'.

`set_stretch(self, stretch)`

Set the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded', or a numeric value in the range 0-1000.

`set_style(self, style)`

Set the font style. Values are: 'normal', 'italic' or 'oblique'.

`set_variant(self, variant)`

Set the font variant. Values are: 'normal' or 'small-caps'.

`set_weight(self, weight)`

Set the font weight. May be either a numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

`matplotlib.font_manager.afmFontProperty(fontpath, font)`

Extract information from an AFM font file.

## Parameters

`font`

[[AFM](#)] The AFM font file from which information will be extracted.

## Returns

`FontEntry`

The extracted font properties.

`matplotlib.font_manager.findSystemFonts(fontpaths=None, fontext='ttf')`

Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.

```
matplotlib.font_manager.findfont(prop, fontext='ttf', directory=None, fall-
                                back_to_default=True, rebuild_if_missing=True)
```

Find a font that most closely matches the given font properties.

### Parameters

#### prop

[str or *FontProperties*] The font properties to search for. This can be either a *FontProperties* object or a string defining a *fontconfig* patterns.

#### fontext

[{'ttf', 'afm'}, default: 'ttf'] The extension of the font file:

- 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
- 'afm': Adobe Font Metrics (.afm)

#### directory

[str, optional] If given, only search this directory and its subdirectories.

#### fallback\_to\_default

[bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

#### rebuild\_if\_missing

[bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

### Returns

#### str

The filename of the best matching font.

### Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the [W3C Cascading Style Sheet, Level 1](#) documentation for a description of the font finding algorithm.

```
matplotlib.font_manager.get_font(filename, hinting_factor=None)
```

```
matplotlib.font_manager.get_fontconfig_fonts(fontext='ttf')
```

List font filenames known to fc-list having the given extension.

`matplotlib.font_manager.get_fonthext_synonyms(fonthext)`

Return a list of file extensions extensions that are synonyms for the given file extension `fileext`.

`matplotlib.font_manager.is_opentype_cff_font(filename)`

Return whether the given font is a Postscript Compact Font Format Font embedded in an OpenType wrapper. Used by the PostScript and PDF backends that can not subset these fonts.

`matplotlib.font_manager.json_dump(data, filename)`

Dump `FontManager` `data` as JSON to the file named `filename`.

**See also:**

`json_load`

## Notes

File paths that are children of the Matplotlib data path (typically, fonts shipped with Matplotlib) are stored relative to that data path (to remain valid across virtualenvs).

This function temporarily locks the output file to prevent multiple processes from overwriting one another's output.

`matplotlib.font_manager.json_load(filename)`

Load a `FontManager` from the JSON file named `filename`.

**See also:**

`json_dump`

`matplotlib.font_manager.list_fonts(directory, extensions)`

Return a list of all fonts matching any of the extensions, found recursively under the directory.

`matplotlib.font_manager.ttfFontProperty(font)`

Extract information from a TrueType font file.

### Parameters

#### `font`

[FT2Font] The TrueType font file from which information will be extracted.

### Returns

#### `FontEntry`

The extracted font properties.

`matplotlib.font_manager.win32FontDirectory()`

Return the user-specified font directory for Win32. This is looked up from the registry key

```
\\"HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\
  ↳Shell Folders\Fonts
```

If the key is not found, %WINDIR%\Fonts will be returned.

```
matplotlib.font_manager.win32InstalledFonts(directory=None, fontext='ttf')
```

Search for fonts in the specified font directory, or use the system directories if none given. Additionally, it is searched for user fonts installed. A list of TrueType font filenames are returned by default, or AFM fonts if *fontext* == 'afm'.

## 18.26 matplotlib.fontconfig\_pattern

A module for parsing and generating `fontconfig` patterns.

```
class matplotlib.fontconfig_pattern.FontconfigPatternParser
```

Bases: `object`

A simple pyparsing-based parser for `fontconfig` patterns.

```
parse(self, pattern)
```

Parse the given `fontconfig pattern` and return a dictionary of key/value pairs useful for initializing a `font_manager.FontProperties` object.

```
matplotlib.fontconfig_pattern.family_escape(repl, string, count=0)
```

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

```
matplotlib.fontconfig_pattern.family_unescape(repl, string, count=0)
```

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

```
matplotlib.fontconfig_pattern.generate_fontconfig_pattern(d)
```

Given a dictionary of key/value pairs, generates a `fontconfig` pattern string.

```
matplotlib.fontconfig_pattern.parse_fontconfig_pattern(pattern)
```

Parse the given `fontconfig pattern` and return a dictionary of key/value pairs useful for initializing a `font_manager.FontProperties` object.

```
matplotlib.fontconfig_pattern.value_escape(repl, string, count=0)
```

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

```
matplotlib.fontconfig_pattern.value_unescape(repl, string, count=0)
```

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

## 18.27 matplotlib.gridspec

`gridspec` contains classes that help to layout multiple `Axes` in a grid-like pattern within a figure.

The `GridSpec` specifies the overall grid structure. Individual cells within the grid are referenced by `SubplotSpecs`.

See the tutorial [Customizing Figure Layouts Using GridSpec and Other Functions](#) for a comprehensive usage guide.

### 18.27.1 Classes

<code>GridSpec(nrows, ncols[, figure, left, ...])</code>	A grid layout to place subplots within a figure.
<code>SubplotSpec(gridspec, num1[, num2])</code>	Specifies the location of a subplot in a <code>GridSpec</code> .
<code>GridSpecBase(nrows, ncols[, height_ratios, ...])</code>	A base class of <code>GridSpec</code> that specifies the geometry of the grid that a subplot will be placed.
<code>GridSpecFromSubplotSpec(nrows, ncols, ...[, ...])</code>	<code>GridSpec</code> whose subplot layout parameters are inherited from the location specified by a given <code>SubplotSpec</code> .

### matplotlib.gridspec.GridSpec

```
class matplotlib.gridspec.GridSpec(nrows, ncols, figure=None, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None, width_ratios=None, height_ratios=None)
```

Bases: `matplotlib.gridspec.GridSpecBase`

A grid layout to place subplots within a figure.

The location of the grid cells is determined in a similar way to `SubplotParams` using `left`, `right`, `top`, `bottom`, `wspace` and `hspace`.

#### Parameters

##### nrows, ncols

[int] The number of rows and columns of the grid.

##### figure

[`Figure`, optional] Only used for constrained layout to create a proper layoutgrid.

##### left, right, top, bottom

[float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also `GridSpec.get_subplot_params`.

**wspace**

[float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also [GridSpec.get\\_subplot\\_params](#).

**hspace**

[float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also [GridSpec.get\\_subplot\\_params](#).

**width\_ratios**

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

**height\_ratios**

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

**`__getstate__(self)`**

**`__init__(self, nrows, ncols, figure=None, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None, width_ratios=None, height_ratios=None)`**

**Parameters****nrows, ncols**

[int] The number of rows and columns of the grid.

**figure**

[[Figure](#), optional] Only used for constrained layout to create a proper layout-grid.

**left, right, top, bottom**

[float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also [GridSpec.get\\_subplot\\_params](#).

**wspace**

[float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also [GridSpec.get\\_subplot\\_params](#).

**hspace**

[float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also [GridSpec.get\\_subplot\\_params](#).

**width\_ratios**

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i]` / `sum(width_ratios)`. If not given, all columns will have the same width.

**height\_ratios**

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i]` / `sum(height_ratios)`. If not given, all rows will have the same height.

---

```
__module__ = 'matplotlib.gridspec'
```

```
get_subplot_params(self, figure=None)
```

Return the [SubplotParams](#) for the GridSpec.

In order of precedence the values are taken from

- non-*None* attributes of the GridSpec
- the provided *figure*
- `rcParams["figure.subplot.*"]`

```
locally_modified_subplot_params(self)
```

Return a list of the names of the subplot parameters explicitly set in the GridSpec.

This is a subset of the attributes of [SubplotParams](#).

```
tight_layout(self, figure, renderer=None, pad=1.08, h_pad=None, w_pad=None,  
rect=None)
```

Adjust subplot parameters to give specified padding.

**Parameters****pad**

[float] Padding between the figure edge and the edges of subplots, as a fraction of the font-size.

**h\_pad, w\_pad**

[float, optional] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

**rect**

[tuple of 4 floats, default: (0, 0, 1, 1), i.e. the whole figure] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into.

### `update(self, **kwargs)`

Update the subplot parameters of the grid.

Parameters that are not explicitly given are not changed. Setting a parameter to *None* resets it to `rcParams["figure.subplot.*"]`.

#### Parameters

##### **left, right, top, bottom**

[float or None, optional] Extent of the subplots as a fraction of figure width or height.

##### **wspace, hspace**

[float, optional] Spacing between the subplots as a fraction of the average subplot width / height.

## matplotlib.gridspec.SubplotSpec

**class** matplotlib.gridspec.**SubplotSpec**(*gridspec*, *num1*, *num2=None*)

Bases: `object`

Specifies the location of a subplot in a *GridSpec*.

---

**Note:** Likely, you'll never instantiate a `SubplotSpec` yourself. Instead you will typically obtain one from a `GridSpec` using item-access.

---

### Parameters

#### `gridspec`

[*GridSpec*] The GridSpec, which the subplot is referencing.

#### `num1, num2`

[int] The subplot will occupy the *num1*-th cell of the given *gridspec*. If *num2* is provided, the subplot will span between *num1*-th cell and *num2*-th cell *inclusive*.

The index starts from 0.

`__dict__ = mappingproxy({ '__module__': 'matplotlib.gridspec', '__doc__': "\n S`

`__eq__(self, other)`

Two SubplotSpecs are considered equal if they refer to the same position(s) in the same *GridSpec*.

`__getstate__(self)`

`__hash__(self)`

Return hash(self).

`__init__(self, gridspec, num1, num2=None)`

Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.gridspec'`

`__repr__(self)`

Return repr(self).

`__weakref__`

list of weak references to the object (if defined)

`property colspan`

The columns spanned by this subplot, as a `range` object.

`get_geometry(self)`

Return the subplot geometry as tuple (*n\_rows*, *n\_cols*, *start*, *stop*).

The indices *start* and *stop* define the range of the subplot within the *GridSpec*. *stop* is inclusive (i.e. for a single cell *start* == *stop*).

**get\_gridspec(self)**  
**get\_position(self, figure, return\_all=<deprecated parameter>)**  
    Update the subplot position from `figure.subplotpars`.  
**get\_rows\_columns(self)**  
    [*Deprecated*] Return the subplot row and column numbers as a tuple (`n_rows`, `n_cols`, `row_start`, `row_stop`, `col_start`, `col_stop`).

## Notes

Deprecated since version 3.3.

**get\_topmost\_subplotspec(self)**  
    Return the topmost `SubplotSpec` instance associated with the subplot.  
**is\_first\_col(self)**  
**is\_first\_row(self)**  
**is\_last\_col(self)**  
**is\_last\_row(self)**  
**property num2**  
**property rowspan**  
    The rows spanned by this subplot, as a `range` object.  
**subgridspec(self, nrows, ncols, \*\*kwargs)**  
    Create a GridSpec within this subplot.  
    The created `GridSpecFromSubplotSpec` will have this `SubplotSpec` as a parent.

## Parameters

**nrows**  
    [int] Number of rows in grid.  
**ncols**  
    [int] Number or columns in grid.

## Returns

`GridSpecFromSubplotSpec`

## Other Parameters

**\*\*kwargs**

All other parameters are passed to `GridSpecFromSubplotSpec`.

## See also:

## *matplotlib.pyplot.subplots*

## Examples

Adding three subplots in the space occupied by a single subplot:

```
fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

## Examples using `matplotlib.gridspec.SubplotSpec`

- sphx\_glr\_gallery\_userdemo\_demo\_gridspec06.py
  - *Customizing Figure Layouts Using GridSpec and Other Functions*
  - *Constrained Layout Guide*

## matplotlib.gridspec.GridSpecBase

Bases: object

A base class of `GridSpec` that specifies the geometry of the grid that a subplot will be placed.

## Parameters

**nrows, ncols**

[int] The number of rows and columns of the grid.

## width\_ratios

[array-like of length  $n_{\text{cols}}$ , optional] Defines the relative widths of the columns. Each column gets a relative width of  $\text{width\_ratios}[i] / \sum(\text{width\_ratios})$ . If not given, all columns will have the same width.

### height ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

```
_dict_ = mappingproxy({'_module_': 'matplotlib.gridspec', '_doc_': '\n A
```

**`__getitem__(self, key)`**  
Create and return a `SubplotSpec` instance.

**`__init__(self, nrows, ncols, height_ratios=None, width_ratios=None)`**

#### Parameters

##### **nrows, ncols**

[int] The number of rows and columns of the grid.

##### **width\_ratios**

[array-like of length `ncols`, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i]` / `sum(width_ratios)`. If not given, all columns will have the same width.

##### **height\_ratios**

[array-like of length `nrows`, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i]` / `sum(height_ratios)`. If not given, all rows will have the same height.

**`__module__ = 'matplotlib.gridspec'`**

**`__repr__(self)`**  
Return repr(self).

**`__weakref__`**  
list of weak references to the object (if defined)

**`get_geometry(self)`**  
Return a tuple containing the number of rows and columns in the grid.

**`get_grid_positions(self, fig, raw=False)`**  
Return the positions of the grid cells in figure coordinates.

#### Parameters

##### **fig**

[*Figure*] The figure the grid should be applied to. The subplot parameters (margins and spacing between subplots) are taken from `fig`.

##### **raw**

[bool, default: False] If `True`, the subplot parameters of the figure are not taken into account. The grid spans the range [0, 1] in both directions without margins and there is no space between grid cells. This is used for constrained\_layout.

#### Returns

##### **bottoms, tops, lefts, rights**

[array] The bottom, top, left, right positions of the grid cells in figure coordinates.

**get\_height\_ratios (self)**

Return the height ratios.

This is *None* if no height ratios have been set explicitly.

**get\_subplot\_params (self, figure=None)****get\_width\_ratios (self)**

Return the width ratios.

This is *None* if no width ratios have been set explicitly.

**property ncols**

The number of columns in the grid.

**new\_subplotspec (self, loc, rowspan=1, colspan=1)**

Create and return a *SubplotSpec* instance.

### Parameters

**loc**

[(int, int)] The position of the subplot in the grid as (row\_index, column\_index).

**rowspan, colspan**

[int, default: 1] The number of rows and columns the subplot should span in the grid.

**property nrows**

The number of rows in the grid.

**set\_height\_ratios (self, height\_ratios)**

Set the relative heights of the rows.

*height\_ratios* must be of length *nrows*. Each row gets a relative height of *height\_ratios*[*i*] / sum(*height\_ratios*).

**set\_width\_ratios (self, width\_ratios)**

Set the relative widths of the columns.

*width\_ratios* must be of length *ncols*. Each column gets a relative width of *width\_ratios*[*i*] / sum(*width\_ratios*).

**subplots (self, \*, sharex=False, sharey=False, squeeze=True, subplot\_kw=None)**

Add all subplots specified by this *GridSpec* to its parent figure.

See *Figure.subplots* for detailed documentation.

## Examples using `matplotlib.gridspec.GridSpecBase`

## `matplotlib.gridspec.GridSpecFromSubplotSpec`

```
class matplotlib.gridspec.GridSpecFromSubplotSpec (nrows, ncols, subplot_spec, wspace=None, hspace=None, height_ratios=None, width_ratios=None)
```

Bases: `matplotlib.gridspec.GridSpecBase`

GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

```
__init__ (self, nrows, ncols, subplot_spec, wspace=None, hspace=None, height_ratios=None, width_ratios=None)
```

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

```
__module__ = 'matplotlib.gridspec'
```

```
get_subplot_params (self, figure=None)
```

Return a dictionary of subplot layout parameters.

```
get_topmost_subplotspec (self)
```

Return the topmost `SubplotSpec` instance associated with the subplot.

## Examples using `matplotlib.gridspec.GridSpecFromSubplotSpec`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_demo\_constrained\_layout.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_gridspec\_nested.py

## 18.28 `matplotlib.image`

The image module supports basic image loading, rescaling and display operations.

```
class matplotlib.image.AxesImage (ax, cmap=None, norm=None, interpolation=None,
                                origin=None, extent=None, filternorm=True, filter-
                                rad=4.0, resample=False, **kwargs)
```

Bases: `matplotlib.image._ImageBase`

An image attached to an Axes.

### Parameters

#### **ax**

[`Axes`] The axes the image will belong to.

#### **cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: '`viridis`') The Colormap instance or registered colormap name used to map scalar data to colors.

#### **norm**

[`Normalize`] Maps luminance to 0-1.

#### **interpolation**

[str, default: `rcParams["image.interpolation"]`] (default: '`antialiased`') Supported values are '`none`', '`antialiased`', '`nearest`', '`bilinear`', '`bicubic`', '`spline16`', '`spline36`', '`hanning`', '`hamming`', '`hermite`', '`kaiser`', '`quadric`', '`catrom`', '`gaussian`', '`bessel`', '`mitchell`', '`sinc`', '`lanczos`', '`blackman`'.

#### **origin**

[{'upper', 'lower'}, default: `rcParams["image.origin"]`] (default: '`upper`') Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention '`upper`' is typically used for matrices and images.

#### **extent**

[tuple, optional] The data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.

**filternorm**

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If filternorm is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad**

[float > 0, default: 4] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

**resample**

[bool, default: False] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

**\*\*kwargs**

[*Artist* properties]

**Parameters****norm**

[*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

**cmap**

[str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

**format\_cursor\_data**(*self, data*)

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

[\*get\\_cursor\\_data\*](#)

**get\_cursor\_data**(*self, event*)

Return the image value at the event position or *None* if the event is outside the image.

**See also:**

[`matplotlib.artist.Artist.get\_cursor\_data`](#)

**get\_extent**(*self*)

Return the image extent as tuple (left, right, bottom, top).

**get\_window\_extent**(*self, renderer=None*)

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**make\_image**(*self, renderer, magnification=1.0, unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns****image**

[(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y**

[float] The upper left corner where the image should be drawn, in pixel space.

**trans**

[Affine2D] The affine transformation from image to pixel space.

**set\_extent**(*self, extent*)

Set the image extent.

**Parameters****extent**

[4-tuple of float] The position and size of the image as tuple (left, right, bottom, top) in data coordinates.

## Notes

This updates `ax.dataLim`, and, if autoscaling, sets `ax.viewLim` to tightly fit the image, regardless of `dataLim`. Autoscaling state is not changed, so following this with `ax.autoscale_view()` will redo the autoscaling in accord with `dataLim`.

```
class matplotlib.image.BboxImage(bbox, cmap=None, norm=None, interpolation=None, origin=None, filternorm=True, filterrad=4.0, resample=False, **kwargs)
```

Bases: `matplotlib.image._ImageBase`

The Image class whose size is determined by the given `bbox`.

`cmap` is a `colors.Colormap` instance `norm` is a `colors.Normalize` instance to map luminance to 0-1

`kwargs` are an optional list of Artist keyword args

`contains` (*self, mouseevent*)

Test whether the mouse event occurred within the image.

`get_window_extent` (*self, renderer=None*)

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`make_image` (*self, renderer, magnification=1.0, unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using `renderer`, with the given `magnification`.

If `unsampled` is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

## Returns

`image`

[`(M, N, 4) uint8 array`] The RGBA image, resampled unless `unsampled` is True.

`x, y`

[float] The upper left corner where the image should be drawn, in pixel space.

`trans`

[`Affine2D`] The affine transformation from image to pixel space.

---

```
class matplotlib.image.FigureImage (fig, cmap=None, norm=None, offsetx=0, offsety=0, origin=None, **kwargs)
Bases: matplotlib.image._ImageBase

An image attached to a figure.

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1
kwargs are an optional list of Artist keyword args

get_extent (self)
    Return the image extent as tuple (left, right, bottom, top).

make_image (self, renderer, magnification=1.0, unsampled=False)
    Normalize, rescale, and colormap this image's data for rendering using renderer, with the given
    magnification.
    If unsampled is True, the image will not be scaled, but an appropriate affine transformation will
    be returned instead.

Returns

    image
        [(M, N, 4) uint8 array] The RGBA image, resampled unless unsampled is True.

    x, y
        [float] The upper left corner where the image should be drawn, in pixel space.

    trans
        [Affine2D] The affine transformation from image to pixel space.

set_data (self, A)
    Set the image array.

zorder = 0

class matplotlib.image.NonUniformImage (ax, *, interpolation='nearest', **kwargs)
Bases: matplotlib.image.AxesImage

Parameters

    interpolation
        ['nearest', 'bilinear'], default: 'nearest'

    **kwargs
        All other keyword arguments are identical to those of AxesImage.

get_extent (self)
    Return the image extent as tuple (left, right, bottom, top).

property is_grayscale
```

**make\_image**(*self, renderer, magnification=1.0, unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns****image**

[(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y**

[float] The upper left corner where the image should be drawn, in pixel space.

**trans**

[Affine2D] The affine transformation from image to pixel space.

**mouseover = False****set\_array**(*self, \*args*)

Retained for backwards compatibility - use set\_data instead.

**Parameters****A**

[array-like]

**set\_cmap**(*self, cmap*)

Set the colormap for luminance data.

**Parameters****cmap**

[*Colormap* or str or None]

**set\_data**(*self, x, y, A*)

Set the grid for the pixel centers, and the pixel values.

**Parameters****x, y**

[1D array-like] Monotonic arrays of shapes (N,) and (M,), respectively, specifying pixel centers.

**A**

[array-like] (M, N) ndarray or masked array of values to be colormapped, or (M, N, 3) RGB array, or (M, N, 4) RGBA array.

**set\_filternorm(self, s)**

Set whether the resize filter normalizes the weights.

See help for [imshow](#).

**Parameters****filternorm**

[bool]

**set\_filterrad(self, s)**

Set the resize filter radius only applicable to some interpolation schemes -- see help for imshow

**Parameters****filterrad**

[positive float]

**set\_interpolation(self, s)****Parameters****s**

[{'nearest', 'bilinear'} or None] If None, use `rcParams["image.interpolation"]` (default: 'antialiased').

**set\_norm(self, norm)**

Set the normalization instance.

**Parameters****norm**

[[Normalize](#) or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```
class matplotlib.image.PcolorImage(ax, x=None, y=None, A=None, cmap=None,
                                     norm=None, **kwargs)
```

Bases: `matplotlib.image.AxesImage`

Make a pcolor-style plot with an irregular rectangular grid.

This uses a variation of the original irregular image code, and it is used by pcolorfast for the corresponding grid type.

**Parameters**

**ax**

[[Axes](#)] The axes the image will belong to.

**x, y**

[1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to `range(N + 1)` and `range(M + 1)`, respectively.

**A**

[array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) ndarray or masked array: values to be colormapped
- (M, N, 3): RGB array
- (M, N, 4): RGBA array

**cmap**

[str or [Colormap](#), default: `rcParams["image.cmap"]`] (default: '`viridis`') The Colormap instance or registered colormap name used to map scalar data to colors.

**norm**

[[Normalize](#)] Maps luminance to 0-1.

**\*\*kwargs**

[[Artist](#) properties]

**get\_cursor\_data (self, event)**

Return the image value at the event position or `None` if the event is outside the image.

**See also:**

`matplotlib.artist.Artist.get\_cursor\_data`

**property is\_grayscale****make\_image (self, renderer, magnification=1.0, unsampled=False)**

Normalize, rescale, and colormap this image's data for rendering using `renderer`, with the given `magnification`.

If `unsampled` is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns****image**

[(M, N, 4) uint8 array] The RGBA image, resampled unless `unsampled` is True.

**x, y**

[float] The upper left corner where the image should be drawn, in pixel space.

**trans**

[Affine2D] The affine transformation from image to pixel space.

**set\_array(self, \*args)**

Retained for backwards compatibility - use set\_data instead.

**Parameters****A**

[array-like]

**set\_data(self, x, y, A)**

Set the grid for the rectangle boundaries, and the data values.

**Parameters****x, y**

[1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to range(N + 1) and range(M + 1), respectively.

**A**

[array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) ndarray or masked array: values to be colormapped
- (M, N, 3): RGB array
- (M, N, 4): RGBA array

**matplotlib.image.composite\_images(images, renderer, magnification=1.0)**

Composite a number of RGBA images into one. The images are composited in the order in which they appear in the *images* list.

**Parameters****images**

[list of Images] Each must have a make\_image method. For each image, can\_composite should return `True`, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

**renderer**

[`RendererBase`]

**magnification**

[float, default: 1] The additional magnification to apply for the renderer in use.

**Returns****image**

[uint8 array (M, N, 4)] The composited RGBA image.

**offset\_x, offset\_y**

[float] The (left, bottom) offset where the composited image should be placed in the output figure.

`matplotlib.image.imread(fname, format=None)`

Read an image from a file into an array.

**Parameters****fname**

[str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

Passing a URL is deprecated. Please open the URL for reading and pass the result to Pillow, e.g. with `PIL.Image.open(urllib.request.urlopen(url))`.

**format**

[str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

**Returns****numpy.array**

The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

`matplotlib.image.imsave(fname, arr, vmin=None, vmax=None, cmap=None, format=None, origin=None, dpi=100, *, metadata=None, pil_kwarg=None)`

Save an array as an image file.

**Parameters****fname**

[str or path-like or file-like] A path or a file-like object to store the image in. If `format` is not set, then the output format is inferred from the extension of `fname`, if any, and from `rcParams["savefig.format"]` (default: 'png') otherwise. If `format` is set, it determines the output format.

**arr**

[array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

**vmin, vmax**

[float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

**cmap**

[str or *Colormap*, default: `rcParams["image.cmap"]`] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

**format**

[str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

**origin**

[{'upper', 'lower'}, default: `rcParams["image.origin"]`] (default: 'upper')] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes.

**dpi**

[float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

**metadata**

[dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

**pil\_kwargs**

[dict, optional] Keyword arguments passed to `PIL.Image.Image.save`. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

**matplotlib.image.pil\_to\_array(*pilImage*)**

Load a `PIL` image and return it as a numpy int array.

**Returns****numpy.array**

The array shape depends on the image type:

- (M, N) for grayscale images.

- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

```
matplotlib.image.thumbnail(infile, thumbfile, scale=0.1, interpolation='bilinear', pre-
                           view=False)
```

Make a thumbnail of image in *infile* with output filename *thumbfile*.

See /gallery/misc/image\_thumbnail\_sgskip.

### Parameters

#### infile

[str or file-like] The image file. Matplotlib relies on [Pillow](#) for image reading, and thus supports a wide range of file formats, including PNG, JPG, TIFF and others.

#### thumbfile

[str or file-like] The thumbnail filename.

#### scale

[float, default: 0.1] The scale factor for the thumbnail.

#### interpolation

[str, default: 'bilinear'] The interpolation scheme used in the resampling. See the *interpolation* parameter of [\*imshow\*](#) for possible values.

#### preview

[bool, default: False] If True, the default backend (presumably a user interface backend) will be used which will cause a figure to be raised if [\*show\*](#) is called. If it is False, the figure is created using [\*FigureCanvasBase\*](#) and the drawing backend is selected as [\*Figure.savefig\*](#) would normally do.

### Returns

#### [\*Figure\*](#)

The figure instance containing the thumbnail.

## 18.29 `matplotlib.legend`

The legend module defines the `Legend` class, which is responsible for drawing legends associated with axes and/or figures.

---

**Important:** It is unlikely that you would ever create a `Legend` instance manually. Most users would normally create a legend via the [`legend`](#) function. For more details on legends there is also a [`legend guide`](#).

---

The `Legend` class is a container of legend handles and legend texts.

The legend handler map specifies how to create legend handles from artists (lines, patches, etc.) in the axes or figures. Default legend handlers are defined in the [`legend\\_handler`](#) module. While not all artist types are covered by the default legend handlers, custom legend handlers can be defined to support arbitrary objects.

See the [`legend guide`](#) for more information.

```
class matplotlib.legend.DraggableLegend(legend, use_blit=False, update='loc')
Bases: matplotlib.offsetbox.DraggableOffsetBox
```

Wrapper around a [`Legend`](#) to support mouse dragging.

#### Parameters

##### legend

[[`Legend`](#)] The [`Legend`](#) instance to wrap.

##### use\_blit

[bool, optional] Use blitting for faster image composition. For details see [`FuncAnimation`](#).

##### update

[{'loc', 'bbox'}, optional] If "loc", update the *loc* parameter of the legend upon finalizing. If "bbox", update the *bbox\_to\_anchor* parameter.

##### finalize\_offset(self)

```
class matplotlib.legend.Legend(parent, handles, labels, loc=None, numpoints=None,
                                markerscale=None, markerfirst=True, scatterpoints=None,
                                scatteryoffsets=None, prop=None, fontsize=None, labelcolor=None,
                                borderpad=None, labelspacing=None, handlelength=None, handleheight=None,
                                handletextpad=None, borderaxespad=None, columnspacing=None, ncol=1,
                                mode=None, fancybox=None, shadow=None, title=None, title_fontsize=None,
                                framealpha=None, edgecolor=None, facecolor=None, bbox_to_anchor=None,
                                bbox_transform=None, frameon=None, handler_map=None)
Bases: matplotlib.artist.Artist
```

Place a legend on the axes at location loc.

#### Parameters

##### parent

[[`Axes`](#) or [`Figure`](#)] The artist that contains the legend.

##### handles

[list of [`Artist`](#)] A list of Artists (lines, patches) to be added to the legend.

**labels**

[list of str] A list of labels to show next to the artists. The length of handles and labels should be the same. If they are not, they are truncated to the smaller of both lengths.

**Other Parameters****loc**

[str or pair of floats, default: `rcParams["legend.loc"]`] (default: 'best') ('best' for axes, 'upper right' for figures) The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor**

[`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to

`Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox (`x`, `y`, `width`, `height`) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (`x`, `y`) places the corner of the legend specified by `loc` at `x`, `y`. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

### ncol

[int, default: 1] The number of columns that the legend has.

### prop

[None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

### fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

### labelcolor

[str or list] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

### numpoints

[int, default: `rcParams["legend.numpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a `Line2D` (line).

### scatterpoints

[int, default: `rcParams["legend.scatterpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot).

### scatteryoffsets

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale**

[float, default: `rcParams["legend.markerscale"]` (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst**

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

**frameon**

[bool, default: `rcParams["legend.frameon"]` (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox**

[bool, default: `rcParams["legend.fancybox"]` (default: True)] Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.

**shadow**

[bool, default: `rcParams["legend.shadow"]` (default: False)] Whether to draw a shadow behind the legend.

**framealpha**

[float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

**facecolor**

["inherit" or color, default: `rcParams["legend.facecolor"]` (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor**

["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

**mode**

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

**bbox\_transform**

[None or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of None (default) the Axes' `transAxes` transform will be used.

**title**

[str or None] The legend's title. Default is no title (None).

**title\_fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: None)] The font size of the legend's title.

**borderpad**

[float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing**

[float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.

**handlelength**

[float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.

**handletextpad**

[float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.

**borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)] The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: `rcParams["legend.columnspacing"]` (default: 2.0)] The spacing between columns, in font-size units.

**handler\_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

## Notes

Users can specify any arbitrary location for the legend using the `bbox_to_anchor` keyword argument. `bbox_to_anchor` can be a `BboxBase` (or derived therefrom) or a tuple of 2 or 4 floats. See `set_bbox_to_anchor` for more detail.

The legend location can be specified by setting `loc` with a tuple of 2 floats, which is interpreted as the lower-left corner of the legend in the normalized axes coordinate.

```
codes = {'best': 0, 'center': 10, 'center left': 6, 'center right': 7, 'lower contains(self, event)
```

Test whether the artist contains the mouse event.

### Parameters

#### mouseevent

```
[matplotlib.backend_bases.MouseEvent]
```

### Returns

#### contains

[bool] Whether any values are within the radius.

#### details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

#### renderer

```
[RendererBase subclass.]
```

## Notes

This method is overridden in the Artist subclasses.

```
draw_frame(self, b)
```

Set whether the legend box patch is drawn.

### Parameters

**b**

[bool]

**get\_bbox\_to\_anchor(self)**

Return the bbox that the legend will be anchored to.

**get\_children(self)**

Return a list of the child *Artists* of this *Artist*.

**classmethod get\_default\_handler\_map()**

A class method that returns the default handler map.

**get\_draggable(self)**

Return True if the legend is draggable, False otherwise.

**get\_frame(self)**

Return the *Rectangle* used to frame the legend.

**get\_frame\_on(self)**

Get whether the legend box patch is drawn.

**static get\_legend\_handler(legend\_handler\_map, orig\_handle)**

Return a legend handler from *legend\_handler\_map* that corresponds to *orig\_handle*.

*legend\_handler\_map* should be a dictionary object (that is returned by the *get\_legend\_handler\_map* method).

It first checks if the *orig\_handle* itself is a key in the *legend\_handler\_map* and return the associated value. Otherwise, it checks for each of the classes in its method-resolution-order. If no matching key is found, it returns None.

**get\_legend\_handler\_map(self)**

Return the handler map.

**get\_lines(self)**

Return the list of *Line2Ds* in the legend.

**get\_patches(self)**

Return the list of *Patches* in the legend.

**get\_texts(self)**

Return the list of *Texts* in the legend.

**get\_tightbbox(self, renderer)**

Like *Legend.get\_window\_extent*, but uses the box for the legend.

**Parameters****renderer**

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**BboxBase**

The bounding box in figure pixel coordinates.

**get\_title(self)**

Return the `Text` instance for the legend title.

**get\_window\_extent(self, renderer=None)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**set\_bbox\_to\_anchor(self, bbox, transform=None)**

Set the bbox that the legend will be anchored to.

**Parameters****bbox**

[`BboxBase` or tuple] The bounding box can be specified in the following ways:

- A `BboxBase` instance
- A tuple of (`left`, `bottom`, `width`, `height`) in the given transform (normalized axes coordinate if `None`)
- A tuple of (`left`, `bottom`) where the width and height will be assumed to be zero.
- `None`, to remove the bbox anchoring, and use the parent bbox.

**transform**

[`Transform`, optional] A transform to apply to the bounding box. If not specified, this will use a transform to the bounding box of the parent.

**classmethod set\_default\_handler\_map(handler\_map)**

A class method to set the default handler map.

**set\_draggable(self, state, use\_blit=False, update='loc')**

Enable or disable mouse dragging support of the legend.

**Parameters****state**

[bool] Whether mouse dragging is enabled.

**use\_blit**

[bool, optional] Use blitting for faster image composition. For details see [FuncAnimation](#).

**update**

[{'loc', 'bbox'}, optional] The legend parameter to be changed when dragged:

- 'loc': update the *loc* parameter of the legend
- 'bbox': update the *bbox\_to\_anchor* parameter of the legend

**Returns**

*DraggableLegend* or *None*

If *state* is True this returns the *DraggableLegend* helper instance. Otherwise this returns *None*.

**set\_frame\_on (self, b)**

Set whether the legend box patch is drawn.

**Parameters****b**

[bool]

**set\_title (self, title, prop=None)**

Set the legend title. Fontproperties can be optionally set with *prop* parameter.

**classmethod update\_default\_handler\_map (handler\_map)**

A class method to update the default handler map.

**zorder = 5**

## 18.30 matplotlib.legend\_handler

Default legend handlers.

It is strongly encouraged to have read the [legend guide](#) before this documentation.

Legend handlers are expected to be a callable object with a following signature.

```
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where *legend* is the legend itself, *orig\_handle* is the original plot, *fontsize* is the fontsize in pixels, and *handlebox* is a OffsetBox instance. Within the call, you should create relevant artists (using relevant properties from the *legend* and/or *orig\_handle*) and add them into the handlebox. The artists needs to be scaled according to the fontsize (note that the size is in pixel, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (`HandlerBase`) with the following method:

```
def legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

```
class matplotlib.legend_handler.HandlerBase(xpad=0.0,      ypad=0.0,      up-
                                             date_func=None)
```

A Base class for default legend handlers.

The derived classes are meant to override `create_artists` method, which has a following signature.:

```
def create_artists(self, legend, orig_handle,
                   xdescent, ydescent, width, height, fontsize,
                   trans):
```

The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

```
adjust_drawing_area(self, legend, orig_handle, xdescent, ydescent, width, height, font-
                     size)
```

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize,
                  trans)
```

```
legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

Return the artist that this HandlerBase generates for the given original artist/handle.

### Parameters

#### legend

[[Legend](#)] The legend for which these legend artists are being created.

#### orig\_handle

[[matplotlib.artist.Artist](#) or similar] The object for which these legend artists are being created.

#### fontsize

[int] The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

#### handlebox

[[matplotlib.offsetbox.OffsetBox](#)] The box which has been created to hold this legend entry's artists. Artists created in the `legend_artist` method must be added to this handlebox inside this method.

```
update_prop(self, legend_handle, orig_handle, legend)
```

```
class matplotlib.legend_handler.HandlerCircleCollection(yoffsets=None,
                                                       sizes=None,
                                                       **kw)
```

Handler for [CircleCollections](#).

### Parameters

**numpoints**

[int] Number of points to show in legend entry.

**yoffsets**

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

## Notes

Any other keyword arguments are given to *HandlerNpoints*.

**create\_collection**(*self, orig\_handle, sizes, offsets, transOffset*)

```
class matplotlib.legend_handler.HandlerErrorbar(xerr_size=0.5,
                                               yerr_size=None,
                                               marker_pad=0.3,      num-
                                               points=None, **kw)
```

Handler for Errorbars.

### Parameters

**marker\_pad**

[float] Padding between points in legend entry.

**numpoints**

[int] Number of points to show in legend entry.

## Notes

Any other keyword arguments are given to *HandlerNpoints*.

**create\_artists**(*self, legend, orig\_handle, xdescent, ydescent, width, height, fontsize, trans*)

**get\_err\_size**(*self, legend, xdescent, ydescent, width, height, fontsize*)

```
class matplotlib.legend_handler.HandlerLine2D(marker_pad=0.3,      num-
                                               points=None, **kw)
```

Handler for *Line2D* instances.

### Parameters

**marker\_pad**

[float] Padding between points in legend entry.

**numpoints**

[int] Number of points to show in legend entry.

## Notes

Any other keyword arguments are given to [HandlerNpoints](#).

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize,
                trans)
class matplotlib.legend_handler.HandlerLineCollection(marker_pad=0.3,
                                                       numpoints=None,
                                                       **kw)
```

Handler for [LineCollection](#) instances.

### Parameters

#### marker\_pad

[float] Padding between points in legend entry.

#### numpoints

[int] Number of points to show in legend entry.

## Notes

Any other keyword arguments are given to [HandlerNpoints](#).

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize,
                trans)
get_numpoints(self, legend)
class matplotlib.legend_handler.HandlerNpoints(marker_pad=0.3,           num-
                                                points=None, **kw)
```

A legend handler that shows *numpoints* points in the legend entry.

### Parameters

#### marker\_pad

[float] Padding between points in legend entry.

#### numpoints

[int] Number of points to show in legend entry.

## Notes

Any other keyword arguments are given to [HandlerBase](#).

```
get_numpoints(self, legend)
```

```
get_xdata(self, legend, xdescent, ydescent, width, height, fontsize)
```

---

```
class matplotlib.legend_handler.HandlerNpointsYoffsets(numpoints=None,
yoffsets=None,
**kw)
```

A legend handler that shows *numpoints* in the legend, and allows them to be individually offset in the y-direction.

### Parameters

#### **numpoints**

[int] Number of points to show in legend entry.

#### **yoffsets**

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

### Notes

Any other keyword arguments are given to *HandlerNpoints*.

**get\_ydata**(*self, legend, xdescent, ydescent, width, height, fontsize*)

```
class matplotlib.legend_handler.HandlerPatch(patch_func=None, **kw)
```

Handler for *Patch* instances.

### Parameters

#### **patch\_func**

[callable, optional] The function that creates the legend key artist. *patch\_func* should have the signature:

```
def patch_func(legend=legend, orig_handle=orig_handle,
xdescent=xdescent, ydescent=ydescent,
width=width, height=height,
fontsize=fontsize)
```

Subsequently the created artist will have its *update\_prop* method called and the appropriate transform will be applied.

### Notes

Any other keyword arguments are given to *HandlerBase*.

**create\_artists**(*self, legend, orig\_handle, xdescent, ydescent, width, height, fontsize,*
*trans*)

```
class matplotlib.legend_handler.HandlerPathCollection(yoffsets=None,
sizes=None, **kw)
```

Handler for *PathCollections*, which are used by *scatter*.

### Parameters

**numpoints**

[int] Number of points to show in legend entry.

**yoffsets**

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

**Notes**

Any other keyword arguments are given to *HandlerNpoints*.

**create\_collection**(*self, orig\_handle, sizes, offsets, transOffset*)

**class** matplotlib.legend\_handler.**HandlerPolyCollection**(*xpad=0.0, ypad=0.0, update\_func=None*)

Handler for *PolyCollection* used in *fill\_between* and *stackplot*.

**create\_artists**(*self, legend, orig\_handle, xdescent, ydescent, width, height, fontsize, trans*)

**class** matplotlib.legend\_handler.**HandlerRegularPolyCollection**(*yoffsets=None, sizes=None, \*\*kw*)

Handler for *RegularPolyCollections*.

**Parameters****numpoints**

[int] Number of points to show in legend entry.

**yoffsets**

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

**Notes**

Any other keyword arguments are given to *HandlerNpoints*.

**create\_artists**(*self, legend, orig\_handle, xdescent, ydescent, width, height, fontsize, trans*)

**create\_collection**(*self, orig\_handle, sizes, offsets, transOffset*)

**get\_numpoints**(*self, legend*)

**get\_sizes**(*self, legend, orig\_handle, xdescent, ydescent, width, height, fontsize*)

**update\_prop**(*self, legend\_handle, orig\_handle, legend*)

**class** matplotlib.legend\_handler.**HandlerStem**(*marker\_pad=0.3, num\_points=None, bottom=None, yoffsets=None, \*\*kw*)

Handler for plots produced by *stem*.

## Parameters

### **marker\_pad**

[float, default: 0.3] Padding between points in legend entry.

### **numpoints**

[int, optional] Number of points to show in legend entry.

### **bottom**

[float, optional]

### **yoffsets**

[array of floats, optional] Length *numpoints* list of y offsets for each point in legend entry.

## Notes

Any other keyword arguments are given to `HandlerNpointsYoffsets`.

`create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)`

`get_ydata(self, legend, xdescent, ydescent, width, height, fontsize)`

**class** `matplotlib.legend_handler.HandlerStepPatch(**kw)`

Handler for `StepPatch` instances.

Any other keyword arguments are given to `HandlerBase`.

`create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)`

**class** `matplotlib.legend_handler.HandlerTuple(ndivide=1, pad=None, **kwargs)`

Handler for Tuple.

Additional kwargs are passed through to `HandlerBase`.

## Parameters

### **ndivide**

[int, default: 1] The number of sections to divide the legend area into. If None, use the length of the input tuple.

### **pad**

[float, default: `rcParams["legend.borderpad"]` (default: 0.4)] Padding in units of fraction of font size.

`create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)`

```
matplotlib.legend_handler.update_from_first_child(tgt, src)
```

## 18.31 matplotlib.lines

The 2D line class which can draw with a variety of line styles, markers and colors.

### 18.31.1 Classes

<code>Line2D(xdata, ydata[, linewidth, linestyle, ...])</code>	A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex.
<code>VertexSelector(line)</code>	Manage the callbacks to maintain a list of selected vertices for <code>Line2D</code> .

#### matplotlib.lines.Line2D

```
class matplotlib.lines.Line2D(xdata, ydata, linewidth=None, linestyle=None,
                               color=None, marker=None, markersize=None,
                               markeredgewidth=None, markeredgecolor=None,
                               markerfacecolor=None, markerfacecoloralt='none', fillstyle=None,
                               antialiased=None, dash_capstyle=None,
                               solid_capstyle=None, dash_joinstyle=None,
                               solid_joinstyle=None, pickradius=5, drawstyle=None,
                               markevery=None, **kwargs)
```

Bases: `matplotlib.artist.Artist`

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create "stepped" lines in various styles.

Create a `Line2D` instance with *x* and *y* data in sequences of *xdata*, *ydata*.

Additional keyword arguments are `Line2D` properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or aa	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or c	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}

continues on

Table 148 – continued from previous page

Property	Description
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

See `set_linestyle()` for a description of the line styles, `set_marker()` for a description of the markers, and `set_drawstyle()` for a description of the draw styles.

```
__init__(self, xdata, ydata, linewidth=None, linestyle=None, color=None, marker=None,
        markersize=None, markeredgewidth=None, markeredgecolor=None, markerface-
        color=None, markerfacecoloralt='none', fillstyle=None, antialiased=None,
        dash_capstyle=None, solid_capstyle=None, dash_joinstyle=None,
        solid_joinstyle=None, pickradius=5, drawstyle=None, markevery=None,
        **kwargs)
```

Create a `Line2D` instance with *x* and *y* data in sequences of *xdata*, *ydata*.

Additional keyword arguments are [Line2D](#) properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<i>Figure</i>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

See `set_linestyle()` for a description of the line styles, `set_marker()` for a description of the markers, and `set_drawstyle()` for a description of the draw styles.

**\_\_module\_\_** = 'matplotlib.lines'

**\_\_str\_\_(self)**

Return str(self).

**property axes**

The `Axes` instance the artist resides in, or `None`.

**contains(self, mouseevent)**

Test whether `mouseevent` occurred on the line.

An event is deemed to have occurred "on" the line if it is less than `self.pickradius` (default: 5 points) away from it. Use `get_pickradius` or `set_pickradius` to get or set the pick radius.

### Parameters

**mouseevent**

[`matplotlib.backend_bases.MouseEvent`]

### Returns

**contains**

[bool] Whether any values are within the radius.

**details**

[dict] A dictionary { 'ind': pointlist }, where `pointlist` is a list of points of the line that are within the `pickradius` around the event position.

TODO: sort returned indices by distance

**draw(self, renderer)**

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer**

[`RendererBase` subclass.]

## Notes

This method is overridden in the Artist subclasses.

```
drawStyleKeys = ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']
drawStyles = {'default': '_draw_lines', 'steps': '_draw_steps_pre', 'steps-mid':
fillStyles = ('full', 'left', 'right', 'bottom', 'top', 'none')
filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D',
get_aa(self)
    Alias for get\_antialiased.
get_antialiased(self)
    Return whether antialiased rendering is used.
get_c(self)
    Alias for get\_color.
get_color(self)
    Return the line color.
    See also set\_color.
get_dash_capstyle(self)
    Return the CapStyle for dashed lines.
    See also set\_dash\_capstyle.
get_dash_joinstyle(self)
    Return the JoinStyle for dashed lines.
    See also set\_dash\_joinstyle.
get_data(self, orig=True)
    Return the line data as an (xdata, ydata) pair.
    If orig is True, return the original data.
get_drawstyle(self)
    Return the drawstyle.
    See also set\_drawstyle.
get_ds(self)
    Alias for get\_drawstyle.
get_fillstyle(self)
    Return the marker fill style.
    See also set\_fillstyle.
get_linestyle(self)
    Return the linestyle.
    See also set\_linestyle.
```

**get\_linewidth(self)**  
Return the linewidth in points.  
See also [set\\_linewidth](#).

**get\_ls(self)**  
Alias for [get\\_linestyle](#).

**get\_lw(self)**  
Alias for [get\\_linewidth](#).

**get\_marker(self)**  
Return the line marker.  
See also [set\\_marker](#).

**get\_markeredgecolor(self)**  
Return the marker edge color.  
See also [set\\_markeredgecolor](#).

**get\_markeredgewidth(self)**  
Return the marker edge width in points.  
See also [set\\_markeredgewidth](#).

**get\_markerfacecolor(self)**  
Return the marker face color.  
See also [set\\_markerfacecolor](#).

**get\_markerfacecoloralt(self)**  
Return the alternate marker face color.  
See also [set\\_markerfacecoloralt](#).

**get\_markersize(self)**  
Return the marker size in points.  
See also [set\\_markersize](#).

**get\_markevery(self)**  
Return the markevery setting for marker subsampling.  
See also [set\\_markevery](#).

**get\_mec(self)**  
Alias for [get\\_markeredgecolor](#).

**get\_mew(self)**  
Alias for [get\\_markeredgewidth](#).

**get\_mfc(self)**  
Alias for [get\\_markerfacecolor](#).

**get\_mfcalt(self)**  
Alias for [get\\_markerfacecoloralt](#).

**get\_ms (self)**  
Alias for `get_markersize`.

**get\_path (self)**  
Return the `Path` object associated with this line.

**get\_pickradius (self)**  
Return the pick radius used for containment tests.  
See `contains` for more details.

**get\_solid\_capstyle (self)**  
Return the `CapStyle` for solid lines.  
See also `set_solid_capstyle`.

**get\_solid\_joinstyle (self)**  
Return the `JoinStyle` for solid lines.  
See also `set_solid_joinstyle`.

**get\_window\_extent (self, renderer)**  
Get the axes bounding box in display space.  
The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**get\_xdata (self, orig=True)**  
Return the xdata.  
If `orig` is `True`, return the original data, else the processed data.

**get\_xydata (self)**  
Return the xy data as a Nx2 numpy array.

**get\_ydata (self, orig=True)**  
Return the ydata.  
If `orig` is `True`, return the original data, else the processed data.

**is\_dashed (self)**  
Return whether line has a dashed linestyle.  
A custom linestyle is assumed to be dashed, we do not inspect the `onoffseq` directly.  
See also `set_linestyle`.

```
lineStyles = {'': '_draw_nothing', ' ': '_draw_nothing', '-': '_draw_solid',
markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', 'x': 'x'}
```

**property pickradius**

Return the pick radius used for containment tests.

See [contains](#) for more details.

**recache (self, always=False)****recache\_always (self)****set\_aa (self, b)**

Alias for [set\\_antialiased](#).

**set\_antialiased (self, b)**

Set whether to use antialiased rendering.

**Parameters****b**

[bool]

**set\_c (self, color)**

Alias for [set\\_color](#).

**set\_color (self, color)**

Set the color of the line.

**Parameters****color**

[color]

**set\_dash\_capstyle (self, s)**

How to draw the end caps if the line is [is\\_dashed](#).

**Parameters****s**[[CapStyle](#) or {'butt', 'projecting', 'round'}]**set\_dash\_joinstyle (self, s)**

How to join segments of the line if it [is\\_dashed](#).

**Parameters****s**[[JoinStyle](#) or {'miter', 'round', 'bevel'}]**set\_dashes (self, seq)**

Set the dash sequence.

The dash sequence is a sequence of floats of even length describing the length of dashes and spaces in points.

For example, (5, 2, 1, 2) describes a sequence of 5 point and 1 point dashes separated by 2 point spaces.

### Parameters

#### **seq**

[sequence of floats (on/off ink in points) or (None, None)] If *seq* is empty or (None, None), the linestyle will be set to solid.

#### **set\_data (self, \*args)**

Set the x and y data.

### Parameters

#### **\*args**

[(2, N) array or two 1D arrays]

#### **set\_drawstyle (self, drawstyle)**

Set the drawstyle of the plot.

The drawstyle determines how the points are connected.

### Parameters

#### **drawstyle**

[{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'] For 'default', the points are connected with straight lines.

The steps variants connect the points with step-like lines, i.e. horizontal lines with vertical steps. They differ in the location of the step:

- 'steps-pre': The step is at the beginning of the line segment, i.e. the line will be at the y-value of point to the right.
- 'steps-mid': The step is halfway between the points.
- 'steps-post': The step is at the end of the line segment, i.e. the line will be at the y-value of the point to the left.
- 'steps' is equal to 'steps-pre' and is maintained for backward-compatibility.

For examples see /gallery/lines\_bars\_and\_markers/step\_demo.

#### **set.ds (self, drawstyle)**

Alias for [set\\_drawstyle](#).

#### **set\_fillstyle (self, fs)**

Set the marker fill style.

### Parameters

**fs**

[{'full', 'left', 'right', 'bottom', 'top', 'none'}] Possible values:

- 'full': Fill the whole marker with the *markerfacecolor*.
- 'left', 'right', 'bottom', 'top': Fill the marker half at the given side with the *markerfacecolor*. The other half of the marker is filled with *markerfacecoloralt*.
- 'none': No filling.

For examples see `marker_fill_styles`.

**set\_linestyle (self, ls)**

Set the linestyle of the line.

**Parameters****ls**

[{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}] Possible values:

- A string:

Linestyle	Description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line
'None' or ' ' or ''	draw nothing

- Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq)

where `onoffseq` is an even length tuple of on and off ink in points. See also `set_dashes ()`.

For examples see `/gallery/lines_bars_and_markers/linestyles`.

**set\_linewidth (self, w)**

Set the line width in points.

**Parameters****w**

[float] Line width, in points.

**set\_ls (self, ls)**

Alias for `set_linestyle`.

**set\_lw**(*self, w*)  
Alias for [set\\_linewidth](#).

**set\_marker**(*self, marker*)  
Set the line marker.

#### Parameters

##### marker

[marker style string, [Path](#) or [MarkerStyle](#)] See [markers](#) for full description of possible arguments.

**set\_markeredgecolor**(*self, ec*)  
Set the marker edge color.

#### Parameters

##### ec

[color]

**set\_markeredgewidth**(*self, ew*)  
Set the marker edge width in points.

#### Parameters

##### ew

[float] Marker edge width, in points.

**set\_markerfacecolor**(*self, fc*)  
Set the marker face color.

#### Parameters

##### fc

[color]

**set\_markerfacecoloralt**(*self, fc*)  
Set the alternate marker face color.

#### Parameters

##### fc

[color]

**set\_markersize**(*self, sz*)  
Set the marker size in points.

#### Parameters

**sz**

[float] Marker size, in points.

**set\_markevery**(*self, every*)

Set the markevery property to subsample the plot when using markers.

e.g., if `every=5`, every 5-th marker will be plotted.

**Parameters****every**

[None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]]  
Which markers to plot.

- `every=None`, every point will be plotted.
- `every=N`, every N-th marker will be plotted starting with marker 0.
- `every=(start, N)`, every N-th marker, starting at point start, will be plotted.
- `every=slice(start, end, N)`, every N-th marker, starting at point start, up to but not including point end, will be plotted.
- `every=[i, j, m, n]`, only markers at points i, j, m, and n will be plotted.
- `every=[True, False, True]`, positions that are True will be plotted.
- `every=0.1`, (i.e. a float) then markers will be spaced at approximately equal distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of every.
- `every=(0.5, 0.1)` (i.e. a length-2 tuple of float), the same functionality as `every=0.1` is exhibited but the first marker will be 0.5 multiplied by the display-coordinate-diagonal-distance along the line.

For examples see [/gallery/lines\\_bars\\_and\\_markers/markevery\\_demo](#).

**Notes**

Setting the markevery property will only show markers at actual data points. When using float arguments to set the markevery property on irregularly spaced data, the markers will likely not appear evenly spaced because the actual data points do not coincide with the theoretical spacing between markers.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first the visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

**set\_mec**(*self, ec*)  
Alias for [set\\_markeredgecolor](#).

**set\_mew**(*self, ew*)  
Alias for [set\\_markeredgewidth](#).

**set\_mfc**(*self, fc*)  
Alias for [set\\_markerfacecolor](#).

**set\_mfcalt**(*self, fc*)  
Alias for [set\\_markerfacecoloralt](#).

**set\_ms**(*self, sz*)  
Alias for [set\\_markersize](#).

**set\_picker**(*self, p*)  
Sets the event picker details for the line.

#### Parameters

**p**

[float or callable[[Artist, Event], tuple[bool, dict]]] If a float, it is used as the pick radius in points.

**set\_pickradius**(*self, d*)  
Set the pick radius used for containment tests.

See [contains](#) for more details.

#### Parameters

**d**

[float] Pick radius, in points.

**set\_solid\_capstyle**(*self, s*)  
How to draw the end caps if the line is solid (not [is\\_dashed](#))

#### Parameters

**s**

[[CapStyle](#) or {'butt', 'projecting', 'round'}]

**set\_solid\_joinstyle**(*self, s*)  
How to join segments if the line is solid (not [is\\_dashed](#)).

#### Parameters

**s**

[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_transform**(*self, t*)

Set the Transformation instance used by this artist.

**Parameters****t**[*matplotlib.transforms.Transform*]**set\_xdata**(*self, x*)

Set the data array for x.

**Parameters****x**

[1D array]

**set\_ydata**(*self, y*)

Set the data array for y.

**Parameters****y**

[1D array]

**update\_from**(*self, other*)Copy properties from *other* to self.**validCap** = ('butt', 'projecting', 'round')**validJoin** = ('miter', 'round', 'bevel')**zorder** = 2

## matplotlib.lines.VertexSelector

```
class matplotlib.lines.VertexSelector(line)
Bases: object
```

Manage the callbacks to maintain a list of selected vertices for `Line2D`. Derived classes should override `process_selected()` to do something with the picks.

Here is an example which highlights the selected verts with red circles:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.lines as lines

class HighlightSelected(lines.VertexSelector):
    def __init__(self, line, fmt='ro', **kwargs):
        lines.VertexSelector.__init__(<self>, line)
        self.markers, = self.axes.plot([], [], fmt, **kwargs)

    def process_selected(self, ind, xs, ys):
        self.markers.set_data(xs, ys)
        self.canvas.draw()

fig, ax = plt.subplots()
x, y = np.random.rand(2, 30)
line, = ax.plot(x, y, 'bs-', picker=5)
```

(continues on next page)

(continued from previous page)

```
selector = HighlightSelected(line)
plt.show()
```

Initialize the class with a `Line2D` instance. The line should already be added to some `matplotlib.axes.Axes` instance and should have the picker property set.

`__dict__ = mappingproxy({ '__module__': 'matplotlib.lines', '__doc__': "\n Mana`

`__init__(self, line)`

Initialize the class with a `Line2D` instance. The line should already be added to some `matplotlib.axes.Axes` instance and should have the picker property set.

`__module__ = 'matplotlib.lines'`

`__weakref__`

list of weak references to the object (if defined)

`onpick(self, event)`

When the line is picked, update the set of selected indices.

`process_selected(self, ind, xs, ys)`

Default "do nothing" implementation of the `process_selected()` method.

### Parameters

`ind`

[list of int] The indices of the selected vertices.

`xs, ys`

[array-like] The coordinates of the selected vertices.

## Examples using `matplotlib.lines.VertexSelector`

### 18.31.2 Functions

---

`segment_hits(cx, cy, x, y, radius)`

Return the indices of the segments in the polyline with coordinates  $(cx, cy)$  that are within a distance  $radius$  of the point  $(x, y)$ .

---

**matplotlib.lines.segment\_hits**

```
matplotlib.lines.segment_hits(cx, cy, x, y, radius)
```

Return the indices of the segments in the polyline with coordinates  $(cx, cy)$  that are within a distance  $radius$  of the point  $(x, y)$ .

**Examples using matplotlib.lines.segment\_hits****18.32 matplotlib.markers**

Functions to handle markers; used by the marker functionality of `plot`, `scatter`, and `errorbar`.

All possible markers are defined here:

marker	symbol	description
"."	●	point
" , "	·	pixel
"o"	●	circle
"v"	▼	triangle_down
"^"	▲	triangle_up
"<"	◀	triangle_left
">"	▶	triangle_right
"1"	▼	tri_down
"2"	▲	tri_up
"3"	◀	tri_left
"4"	▶	tri_right
"8"	●	octagon
"s"	■	square
"p"	◆	pentagon
"P"	✚	plus (filled)
"*"	★	star
"h"	◆	hexagon1
"H"	◆	hexagon2
"+"	+	plus
"x"	✗	x
"X"	✗	x (filled)
"D"	◆	diamond

Table 151 – continued from previous page

marker	symbol	description
"d"	◆	thin_diamond
" "		vline
"_"	—	hline
0 (TICKLEFT)	—	tickleft
1 (TICKRIGHT)	—	tickright
2 (TICKUP)		tickup
3 (TICKDOWN)		tickdown
4 (CARETLEFT)	◀	caretleft
5 (CARETRIGHT)	▶	caretright
6 (CARETUP)	▲	caretup
7 (CARETDOWN)	▼	caretdown
8 (CARETLEFTBASE)	◀	caretleft (centered at base)
9 (CARETRIGHTBASE)	▶	caretright (centered at base)
10 (CARETUPBASE)	▲	caretup (centered at base)
11 (CARETDOWNBASE)	▼	caretdown (centered at base)
"None", " " or ""		nothing
'\$...\$'	f	Render the string using mathtext. E.g. "\$f\$" for marker showing the letter f.
verts		A list of (x, y) pairs used for Path vertices. The center of the marker is located at (0,0).
path		A <a href="#">Path</a> instance.
(numsides, 0, angle)		A regular polygon with numsides sides, rotated by angle.
(numsides, 1, angle)		A star-like symbol with numsides sides, rotated by angle.
(numsides, 2, angle)		An asterisk with numsides sides, rotated by angle.

None is the default which means 'nothing', however this table is referred to from other docs for the valid inputs from marker inputs and in those cases None still means 'default'.

Note that special symbols can be defined via the [STIX math font](#), e.g. "\$\u266B\$". For an overview over the STIX font symbols refer to the [STIX font table](#). Also see the [/gallery/text\\_labels\\_and\\_annotations/stix\\_fonts\\_demo](#).

Integer numbers from 0 to 11 create lines and triangles. Those are equally accessible via capitalized variables, like CARETDOWNBASE. Hence the following are equivalent:

```
plt.plot([1, 2, 3], marker=11)
plt.plot([1, 2, 3], marker=matplotlib.markers.CARETDOWNBASE)
```

Examples showing the use of markers:

- [/gallery/lines\\_bars\\_and\\_markers/marker\\_reference](#)
- [/gallery/shapes\\_and\\_collections/marker\\_path](#)
- [/gallery/lines\\_bars\\_and\\_markers/scatter\\_star\\_poly](#)

### 18.32.1 Classes

---

<code>MarkerStyle([marker, fillstyle])</code>	A class representing marker types.
---	------------------------------------

---

## matplotlib.markers.MarkerStyle

**class** `matplotlib.markers.MarkerStyle(marker=None, fillstyle=None)`  
Bases: `object`

A class representing marker types.

Instances are immutable. If you need to change anything, create a new instance.

### Attributes

#### markers

[list] All known markers.

#### filled\_markers

[list] All known filled markers. This is a subset of *markers*.

#### fillstyles

[list] The supported fillstyles.

### Parameters

#### marker

[str, array-like, Path, MarkerStyle, or None, default: None]

- Another instance of *MarkerStyle* copies the details of that *marker*.
- *None* means no marker.
- For other possible marker values see the module docstring `matplotlib.markers`.

#### fillstyle

[str, default: 'full'] One of 'full', 'left', 'right', 'bottom', 'top', 'none'.

#### \_\_bool\_\_(self)

`_dict_ = mappingproxy({ '__module__': 'matplotlib.markers', '__doc__': '\n A`

#### \_\_init\_\_(self, marker=None, fillstyle=None)

### Parameters

#### marker

[str, array-like, Path, MarkerStyle, or None, default: None]

- Another instance of *MarkerStyle* copies the details of that marker.
- *None* means no marker.
- For other possible marker values see the module docstring `matplotlib.markers`.

### `fillstyle`

[str, default: 'full'] One of 'full', 'left', 'right', 'bottom', 'top', 'none'.

`__module__ = 'matplotlib.markers'`

`__weakref__`

list of weak references to the object (if defined)

`filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd')`  
`fillstyles = ('full', 'left', 'right', 'bottom', 'top', 'none')`

`get_alt_path(self)`

Return a `Path` for the alternate part of the marker.

For unfilled markers, this is *None*; for filled markers, this is the area to be drawn with `markerfacecoloralt`.

`get_alt_transform(self)`

Return the transform to be applied to the `Path` from `MarkerStyle.get_alt_path()`.

`get_capstyle(self)`

`get_fillstyle(self)`

`get_joinstyle(self)`

`get_marker(self)`

`get_path(self)`

Return a `Path` for the primary part of the marker.

For unfilled markers this is the whole marker, for filled markers, this is the area to be drawn with `markerfacecolor`.

`get_snap_threshold(self)`

`get_transform(self)`

Return the transform to be applied to the `Path` from `MarkerStyle.get_path()`.

`is_filled(self)`

`markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', 'P': 'diamond', 'x': 'x', 'X': 'x', 'd': 'diamond', 'D': 'diamond'}`

`set_fillstyle(self, fillstyle)`

[*Deprecated*]

## Notes

Deprecated since version 3.4:

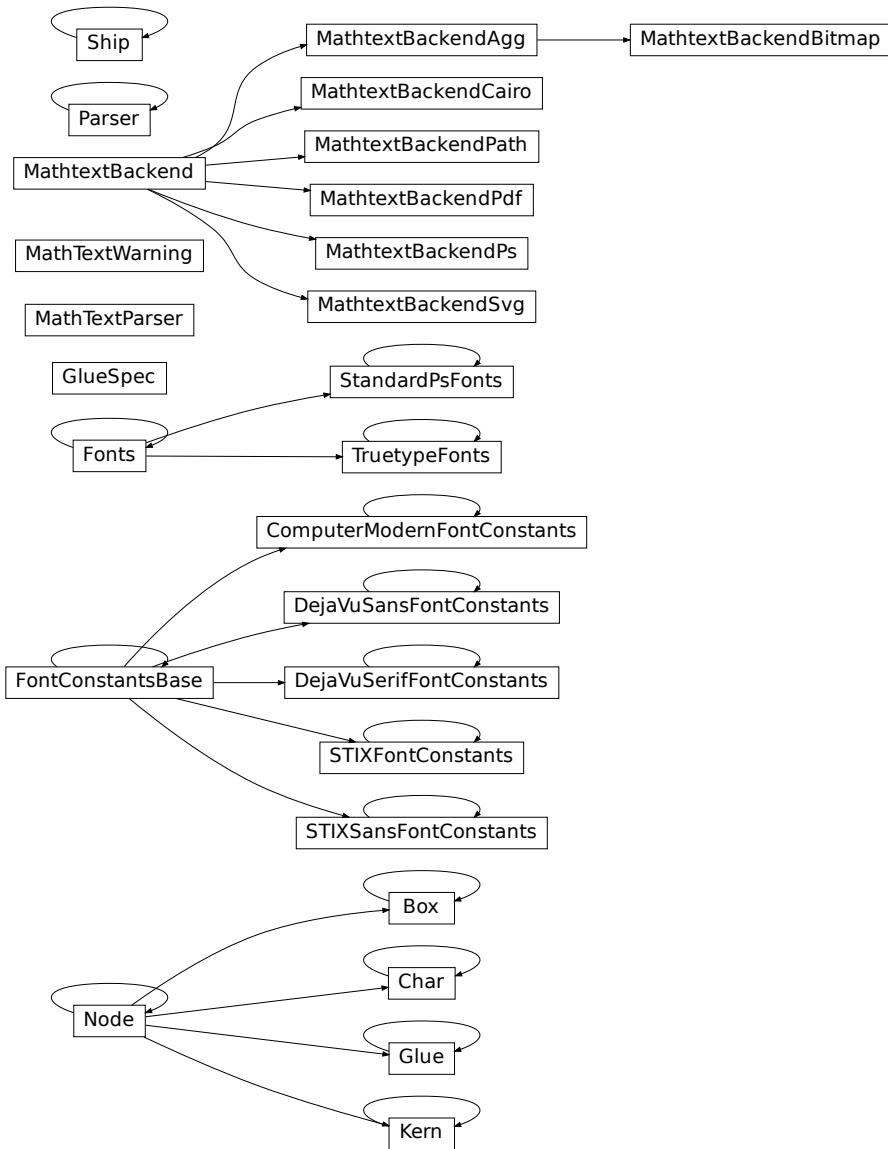

`set_marker`(*self, marker*)  
[*Deprecated*]

## Notes

Deprecated since version 3.4:

## Examples using `matplotlib.markers.MarkerStyle`

### 18.33 `matplotlib.mathtext`

A module for parsing a subset of the TeX math syntax and rendering it to a Matplotlib backend.

For a tutorial of its usage, see [Writing mathematical expressions](#). This document is primarily concerned with implementation details.

The module uses [pyparsing](#) to parse the TeX expression.

The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper tweaking and metrics for those fonts.

**class** `matplotlib.mathtext.GlueSpec(**kwargs)`  
 Bases: `object`

[*Deprecated*] See `Glue`.

## Notes

Deprecated since version 3.3.

**copy** (*self*)

**classmethod factory** (*glue\_type*)

**class** `matplotlib.mathtext.MathTextParser(output)`  
 Bases: `object`

Create a MathTextParser for the given backend *output*.

**get\_depth** (*self*, *texstr*, *dpi*=120, *fontsize*=14)

[*Deprecated*] Get the depth of a mathtext string.

## Parameters

**texstr**

[str] A valid mathtext string, e.g., r'IQ: \$sigma\_i=15\$'.

**dpi**

[float] The dots-per-inch setting used to render the text.

## Returns

**int**

Offset of the baseline from the bottom of the image, in pixels.

## Notes

Deprecated since version 3.4.

**parse** (*self*, *s*, *dpi*=72, *prop=None*, \*, *\_force\_standard\_ps\_fonts=False*)

Parse the given math expression *s* at the given *dpi*. If *prop* is provided, it is a `FontProperties` object specifying the "default" font to use in the math expression, used for all non-math text.

The results are cached, so multiple calls to `parse` with the same expression should be fast.

**to\_mask** (*self*, *texstr*, *dpi*=120, *fontsize*=14)

[*Deprecated*] Convert a mathtext string to a grayscale array and depth.

## Parameters

### **texstr**

[str] A valid mathtext string, e.g., r'IQ: \$\sigma\_i=15\$'.

### **dpi**

[float] The dots-per-inch setting used to render the text.

### **fontsize**

[int] The font size in points

## Returns

### **array**

[2D uint8 alpha] Mask array of rasterized tex.

### **depth**

[int] Offset of the baseline from the bottom of the image, in pixels.

## Notes

Deprecated since version 3.4.

**to\_png** (*self, filename, texstr, color='black', dpi=120, fontsize=14*)  
[Deprecated] Render a tex expression to a PNG file.

## Parameters

### **filename**

A writable filename or fileobject.

### **texstr**

[str] A valid mathtext string, e.g., r'IQ: \$\sigma\_i=15\$'.

### **color**

[color] The text color.

### **dpi**

[float] The dots-per-inch setting used to render the text.

### **fontsize**

[int] The font size in points.

## Returns

**int**

Offset of the baseline from the bottom of the image, in pixels.

**Notes**

Deprecated since version 3.4.

**to\_rgba** (*self, texstr, color='black', dpi=120, fontsize=14*)

[*Deprecated*] Convert a mathtext string to an RGBA array and depth.

**Parameters****texstr**

[str] A valid mathtext string, e.g., r'IQ: \$sigma\_i=15\$'.

**color**

[color] The text color.

**dpi**

[float] The dots-per-inch setting used to render the text.

**fontsize**

[int] The font size in points.

**Returns****array**

[(M, N, 4) array] RGBA color values of rasterized tex, colorized with *color*.

**depth**

[int] Offset of the baseline from the bottom of the image, in pixels.

**Notes**

Deprecated since version 3.4.

**exception** matplotlib.mathtext.**MathTextWarning**

Bases: Warning

**class** matplotlib.mathtext.**MathTextBackend**

Bases: object

The base class for the mathtext backend-specific code. *MathTextBackend* subclasses interface between mathtext and specific Matplotlib graphics backends.

Subclasses need to override the following:

- *render\_glyph()*

- `render_rect_filled()`
- `get_results()`

And optionally, if you need to use a FreeType hinting style:

- `get_hinting_type()`

`get_hinting_type(self)`

Get the FreeType hinting type to use with this particular backend.

`get_results(self, box)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(self, ox, oy, info)`

Draw a glyph described by `info` to the reference point (`ox, oy`).

`render_rect_filled(self, x1, y1, x2, y2)`

Draw a filled black rectangle from (`x1, y1`) to (`x2, y2`).

`set_canvas_size(self, w, h, d)`

Set the dimension of the drawing canvas.

**class** `matplotlib.mathtext.MathTextBackendAgg`

Bases: `matplotlib.mathtext.MathTextBackend`

Render glyphs and rectangles to an FTImage buffer, which is later transferred to the Agg image by the Agg backend.

`get_hinting_type(self)`

Get the FreeType hinting type to use with this particular backend.

`get_results(self, box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(self, ox, oy, info)`

Draw a glyph described by `info` to the reference point (`ox, oy`).

`render_rect_filled(self, x1, y1, x2, y2)`

Draw a filled black rectangle from (`x1, y1`) to (`x2, y2`).

`set_canvas_size(self, w, h, d)`

Set the dimension of the drawing canvas.

**class** `matplotlib.mathtext.MathTextBackendBitmap(**kwargs)`

Bases: `matplotlib.mathtext.MathTextBackendAgg`

*[Deprecated]*

## Notes

Deprecated since version 3.4:

**get\_results** (*self, box, used\_characters*)

Return a backend-specific tuple to return to the backend after all processing is done.

**class** `matplotlib.mathtext.MathTextBackendCairo` (\*\*kwargs)

Bases: `matplotlib.mathtext.MathTextBackend`

[*Deprecated*] Store information to write a mathtext rendering to the Cairo backend.

## Notes

Deprecated since version 3.4.

**get\_results** (*self, box, used\_characters*)

Return a backend-specific tuple to return to the backend after all processing is done.

**render\_glyph** (*self, ox, oy, info*)

Draw a glyph described by *info* to the reference point (*ox, oy*).

**render\_rect\_filled** (*self, x1, y1, x2, y2*)

Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).

**class** `matplotlib.mathtext.MathTextBackendPath`

Bases: `matplotlib.mathtext.MathTextBackend`

Store information to write a mathtext rendering to the text path machinery.

**get\_results** (*self, box, used\_characters*)

Return a backend-specific tuple to return to the backend after all processing is done.

**render\_glyph** (*self, ox, oy, info*)

Draw a glyph described by *info* to the reference point (*ox, oy*).

**render\_rect\_filled** (*self, x1, y1, x2, y2*)

Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).

**class** `matplotlib.mathtext.MathTextBackendPdf` (\*\*kwargs)

Bases: `matplotlib.mathtext.MathTextBackend`

[*Deprecated*] Store information to write a mathtext rendering to the PDF backend.

### Notes

Deprecated since version 3.4.

**get\_results** (*self, box, used\_characters*)

Return a backend-specific tuple to return to the backend after all processing is done.

**render\_glyph** (*self, ox, oy, info*)

Draw a glyph described by *info* to the reference point (*ox, oy*).

**render\_rect\_filled** (*self, x1, y1, x2, y2*)

Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).

**class** `matplotlib.mathtext.MathTextBackendPs` (*\*\*kwargs*)

Bases: `matplotlib.mathtext.MathTextBackend`

[*Deprecated*] Store information to write a mathtext rendering to the PostScript backend.

### Notes

Deprecated since version 3.4.

**get\_results** (*self, box, used\_characters*)

Return a backend-specific tuple to return to the backend after all processing is done.

**render\_glyph** (*self, ox, oy, info*)

Draw a glyph described by *info* to the reference point (*ox, oy*).

**render\_rect\_filled** (*self, x1, y1, x2, y2*)

Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).

**class** `matplotlib.mathtext.MathTextBackendSvg` (*\*\*kwargs*)

Bases: `matplotlib.mathtext.MathTextBackend`

[*Deprecated*] Store information to write a mathtext rendering to the SVG backend.

### Notes

Deprecated since version 3.4.

**get\_results** (*self, box, used\_characters*)

Return a backend-specific tuple to return to the backend after all processing is done.

**render\_glyph** (*self, ox, oy, info*)

Draw a glyph described by *info* to the reference point (*ox, oy*).

**render\_rect\_filled** (*self, x1, y1, x2, y2*)

Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).

`matplotlib.mathtext.get_unicode_index` (*symbol, math=True*)

Return the integer index (from the Unicode table) of *symbol*.

### Parameters

**symbol**

[str] A single unicode character, a TeX command (e.g. r'pi') or a Type1 symbol name (e.g. 'phi').

**math**

[bool, default: True] If False, always treat as a single unicode character.

```
matplotlib.mathtext.math_to_image(s, filename_or_obj, prop=None, dpi=None, for-  
mat=None)
```

Given a math expression, renders it in a closely-clipped bounding box to an image file.

**Parameters****s**

[str] A math expression. The math portion must be enclosed in dollar signs.

**filename\_or\_obj**

[str or path-like or file-like] Where to write the image data.

**prop**

[*FontProperties*, optional] The size and style of the text.

**dpi**

[float, optional] The output dpi. If not set, the dpi is determined as for *Figure.savefig*.

**format**

[str, optional] The output format, e.g., 'svg', 'pdf', 'ps' or 'png'. If not set, the format is determined as for *Figure.savefig*.

```
matplotlib.mathtext.ship(ox, oy, box)
```

[*Deprecated*]

**Notes**

Deprecated since version 3.4:

## 18.34 matplotlib.mlab

Numerical python functions written for compatibility with MATLAB commands with the same names. Most numerical python functions can be found in the `numpy` and `scipy` libraries. What remains here is code for performing spectral computations.

### 18.34.1 Spectral functions

#### `cohere`

Coherence (normalized cross spectral density)

#### `csd`

Cross spectral density using Welch's average periodogram

#### `detrend`

Remove the mean or best fit line from an array

#### `psd`

Power spectral density using Welch's average periodogram

#### `specgram`

Spectrogram (spectrum over segments of time)

#### `complex_spectrum`

Return the complex-valued frequency spectrum of a signal

#### `magnitude_spectrum`

Return the magnitude of the frequency spectrum of a signal

#### `angle_spectrum`

Return the angle (wrapped phase) of the frequency spectrum of a signal

#### `phase_spectrum`

Return the phase (unwrapped angle) of the frequency spectrum of a signal

#### `detrend_mean`

Remove the mean from a line.

#### `detrend_linear`

Remove the best fit line from a line.

#### `detrend_none`

Return the original line.

#### `stride_windows`

Get all windows in an array in a memory-efficient manner

**class** `matplotlib.mlab.GaussianKDE` (*dataset*, *bw\_method=None*)

Bases: `object`

Representation of a kernel-density estimate using Gaussian kernels.

#### Parameters

**dataset**

[array-like] Datapoints to estimate from. In case of univariate data this is a 1-D array, otherwise a 2D array with shape (# of dims, # of data).

**bw\_method**

[str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as only parameter and return a scalar. If None (default), 'scott' is used.

**Attributes****dataset**

[ndarray] The dataset with which `gaussian_kde` was initialized.

**dim**

[int] Number of dimensions.

**num\_dp**

[int] Number of datapoints.

**factor**

[float] The bandwidth factor, obtained from `kde.covariance_factor`, with which the covariance matrix is multiplied.

**covariance**

[ndarray] The covariance matrix of `dataset`, scaled by the calculated bandwidth (`kde.factor`).

**inv\_cov**

[ndarray] The inverse of `covariance`.

**Methods**

<code>kde.evaluate(points)</code>	(ndarray) Evaluate the estimated pdf on a provided set of points.
<code>kde(points)</code>	(ndarray) Same as <code>kde.evaluate(points)</code>

**covariance\_factor(*self*)****evaluate(*self, points*)**

Evaluate the estimated pdf on a set of points.

**Parameters**

**points**

[(# of dimensions, # of points)-array] Alternatively, a (# of dimensions,) vector can be passed in and treated as a single point.

**Returns****(# of points,)-array**

The values at each point.

**Raises****ValueError**

[if the dimensionality of the input points is different] than the dimensionality of the KDE.

**scotts\_factor** (*self*)

**silverman\_factor** (*self*)

`matplotlib.mlab.angle_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)`

Compute the angle of the frequency spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

**Parameters****x**

[1-D array or sequence] Array or sequence containing the data

**Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

**Returns****spectrum**

[1-D array] The angle of the frequency spectrum (wrapped phase spectrum).

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**See also:*****psd***

Returns the power spectral density.

***complex\_spectrum***

Returns the complex-valued frequency spectrum.

***magnitude\_spectrum***

Returns the absolute value of the *complex\_spectrum*.

***angle\_spectrum***

Returns the angle of the *complex\_spectrum*.

***phase\_spectrum***

Returns the phase (unwrapped angle) of the *complex\_spectrum*.

***specgram***

Can return the complex spectrum of segments within the signal.

```
matplotlib.mlab.cohere(x, y, NFFT=256, Fs=2, detrend=<function detrend_none
at 0x7f27ec1cf1f0>, window=<function window_hanning at
0x7f27ec1c8dc0>, nooverlap=0, pad_to=None, sides='default',
scale_by_freq=None)
```

The coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

**Parameters**

**x, y**

Array or sequence containing the data

**Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to *NFFT*

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between segments.

**Returns****Cxy**

[1-D array] The coherence vector.

**freqs**

[1-D array] The frequencies for the elements in *Cxy*.

**See also:****[psd\(\)](#), [csd\(\)](#)**

For information about the methods used to compute  $P_{xy}$ ,  $P_{xx}$  and  $P_{yy}$ .

```
matplotlib.mlab.complex_spectrum(x, Fs=None, window=None, pad_to=None,
                                   sides=None)
```

Compute the complex-valued frequency spectrum of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

**Parameters****x**

[1-D array or sequence] Array or sequence containing the data

**Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum

(the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

## Returns

### `spectrum`

[1-D array] The complex-valued frequency spectrum.

### `freqs`

[1-D array] The frequencies corresponding to the elements in *spectrum*.

## See also:

### `psd`

Returns the power spectral density.

### `complex_spectrum`

Returns the complex-valued frequency spectrum.

### `magnitude_spectrum`

Returns the absolute value of the `complex_spectrum`.

### `angle_spectrum`

Returns the angle of the `complex_spectrum`.

### `phase_spectrum`

Returns the phase (unwrapped angle) of the `complex_spectrum`.

### `specgram`

Can return the complex spectrum of segments within the signal.

```
matplotlib.mlab.csd(x, y, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)
```

Compute the cross-spectral density.

The cross spectral density  $P_{xy}$  by Welch's average periodogram method. The vectors *x* and *y* are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of *x* and *y* are averaged over each segment to compute  $P_{xy}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < \text{NFFT}$  or  $\text{len}(y) < \text{NFFT}$ , they will be zero padded to *NFFT*.

## Parameters

**x, y**

[1-D arrays or sequences] Arrays or sequences containing the data

**Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to *NFFT*

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between segments.

**Returns****Pxy**

[1-D array] The values for the cross spectrum  $P_{xy}$  before scaling (real valued)

**freqs**

[1-D array] The frequencies corresponding to the elements in  $P_{xy}$

**See also:****[psd](#)**

equivalent to setting  $y = x$ .

**References**

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

`matplotlib.mlab.detrend(x, key=None, axis=None)`

Return  $x$  with its trend removed.

**Parameters****x**

[array or sequence] Array or sequence containing the data.

**key**

[{'default', 'constant', 'mean', 'linear', 'none'} or function] The detrending algorithm to use. 'default', 'mean', and 'constant' are the same as [detrend\\_mean](#). 'linear' is the same as [detrend\\_linear](#). 'none' is the same as [detrend\\_none](#). The default is 'mean'. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

**axis**

[int] The axis along which to do the detrending.

**See also:****[detrend\\_mean](#)**

Implementation of the 'mean' algorithm.

**[detrend\\_linear](#)**

Implementation of the 'linear' algorithm.

**[detrend\\_none](#)**

Implementation of the 'none' algorithm.

`matplotlib.mlab.detrend_linear(y)`

Return x minus best fit line; 'linear' detrending.

**Parameters****y**

[0-D or 1-D array or sequence] Array or sequence containing the data

**axis**

[int] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

**See also:****[detrend\\_mean](#)**

Another detrend algorithm.

**[detrend\\_none](#)**

Another detrend algorithm.

**[detrend](#)**

A wrapper around all the detrend algorithms.

`matplotlib.mlab.detrend_mean(x, axis=None)`

Return x minus the mean(x).

**Parameters****x**

[array or sequence] Array or sequence containing the data Can have any dimensionality

**axis**

[int] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

**See also:****[detrend\\_linear](#)**

Another detrend algorithm.

**[detrend\\_none](#)**

Another detrend algorithm.

### **`detrend`**

A wrapper around all the detrend algorithms.

```
matplotlib.mlab.detrend_none(x, axis=None)
```

Return x: no detrending.

#### **Parameters**

##### **x**

[any object] An object containing the data

##### **axis**

[int] This parameter is ignored. It is included for compatibility with `detrend_mean`

**See also:**

#### **`detrend_mean`**

Another detrend algorithm.

#### **`detrend_linear`**

Another detrend algorithm.

#### **`detrend`**

A wrapper around all the detrend algorithms.

```
matplotlib.mlab.magnitude_spectrum(x, Fs=None, window=None, pad_to=None,  
sides=None)
```

Compute the magnitude (absolute value) of the frequency spectrum of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

#### **Parameters**

##### **x**

[1-D array or sequence] Array or sequence containing the data

##### **Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

##### **window**

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

**Returns****spectrum**

[1-D array] The magnitude (absolute value) of the frequency spectrum.

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**See also:****`psd`**

Returns the power spectral density.

**`complex_spectrum`**

Returns the complex-valued frequency spectrum.

**`magnitude_spectrum`**

Returns the absolute value of the `complex_spectrum`.

**`angle_spectrum`**

Returns the angle of the `complex_spectrum`.

**`phase_spectrum`**

Returns the phase (unwrapped angle) of the `complex_spectrum`.

**`specgram`**

Can return the complex spectrum of segments within the signal.

```
matplotlib.mlab.phase_spectrum(x,      Fs=None,      window=None,      pad_to=None,
                                sides=None)
```

Compute the phase of the frequency spectrum (unwrapped phase spectrum) of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

**Parameters**

**x**

[1-D array or sequence] Array or sequence containing the data

**fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

**Returns****spectrum**

[1-D array] The phase of the frequency spectrum (unwrapped phase spectrum).

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**See also:*****psd***

Returns the power spectral density.

***complex\_spectrum***

Returns the complex-valued frequency spectrum.

***magnitude\_spectrum***

Returns the absolute value of the *complex\_spectrum*.

**`angle_spectrum`**

Returns the angle of the `complex_spectrum`.

**`phase_spectrum`**

Returns the phase (unwrapped angle) of the `complex_spectrum`.

**`specgram`**

Can return the complex spectrum of segments within the signal.

```
matplotlib.mlab.psd(x, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)
```

Compute the power spectral density.

The power spectral density  $P_{xx}$  by Welch's average periodogram method. The vector  $x$  is divided into  $NFFT$  length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The  $|\text{fft}(i)|^2$  of each segment  $i$  are averaged to compute  $P_{xx}$ .

If  $\text{len}(x) < NFFT$ , it will be zero padded to  $NFFT$ .

**Parameters****x**

[1-D array or sequence] Array or sequence containing the data

**Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.

**window**

[callable or ndarray, default: `window_hanning`] A function or a vector of length  $NFFT$ . To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot,

allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad\_to* equal to *NFFT*

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz<sup>-1</sup>. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between segments.

**Returns****Pxx**

[1-D array] The values for the power spectrum  $P_{xx}$  (real valued)

**freqs**

[1-D array] The frequencies corresponding to the elements in  $P_{xx}$

**See also:*****specgram***

*specgram* differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.

***magnitude\_spectrum***

returns the magnitude spectrum.

***csd***

returns the spectral density between two signals.

## References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

```
matplotlib.mlab.specgram(x,      NFFT=None,      Fs=None,      detrend=None,      win-
                           dow=None,    nooverlap=None,   pad_to=None,    sides=None,
                           scale_by_freq=None, mode=None)
```

Compute a spectrogram.

Compute and plot a spectrogram of data in `x`. Data are split into `NFFT` length segments and the spectrum of each section is computed. The windowing function `window` is applied to each segment, and the amount of overlap of each segment is specified with `noverlap`.

### Parameters

#### `x`

[array-like] 1-D array or sequence.

#### `Fs`

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.

#### `window`

[callable or ndarray, default: `window_hanning`] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

#### `sides`

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

#### `pad_to`

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from `NFFT`, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to `NFFT`

#### `NFFT`

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use `pad_to` for this instead.

#### `detrend`

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 128] The number of points of overlap between blocks.

**mode**

[str, default: 'psd']

**What sort of spectrum to use:****'psd'**

Returns the power spectral density.

**'complex'**

Returns the complex-valued frequency spectrum.

**'magnitude'**

Returns the magnitude spectrum.

**'angle'**

Returns the phase spectrum without unwrapping.

**'phase'**

Returns the phase spectrum with unwrapping.

**Returns****spectrum**

[array-like] 2D array, columns are the periodograms of successive segments.

**freqs**

[array-like] 1-D array, frequencies corresponding to the rows in *spectrum*.

**t**

[array-like] 1-D array, the times corresponding to midpoints of segments (i.e the columns in *spectrum*).

### See also:

[`psd`](#)

differs in the overlap and in the return values.

[`complex\_spectrum`](#)

similar, but with complex valued frequencies.

[`magnitude\_spectrum`](#)

similar single segment when mode is 'magnitude'.

[`angle\_spectrum`](#)

similar to single segment when mode is 'angle'.

[`phase\_spectrum`](#)

similar to single segment when mode is 'phase'.

### Notes

detrend and scale\_by\_freq only apply when *mode* is set to 'psd'.

`matplotlib.mlab.stride_windows(x, n, nooverlap=None, axis=0)`

Get all windows of x with length n as a single array, using strides to avoid data duplication.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

### Parameters

**x**

[1D array or sequence] Array or sequence containing the data.

**n**

[int] The number of data points in each window.

**nooverlap**

[int, default: 0 (no overlap)] The overlap between adjacent windows.

**axis**

[int] The axis along which the windows will run.

Another window algorithm.

## 18.35 `matplotlib.offsetbox`

Container classes for *Artists*.

### `OffsetBox`

The base of all container artists defined in this module.

`AnchoredOffsetbox, AnchoredText`

Anchor and align an arbitrary [Artist](#) or a text relative to the parent axes or a specific anchor point.

### [DrawingArea](#)

A container with fixed width and height. Children have a fixed position inside the container and may be clipped.

### [HPacker, VPacker](#)

Containers for layouting their children vertically or horizontally.

### [PaddedBox](#)

A container to add a padding around an [Artist](#).

### [TextArea](#)

Contains a single [Text](#) instance.

```
class matplotlib.offsetbox.AnchoredOffsetbox(loc, pad=0.4, borderpad=0.5, child=None, prop=None, frameon=True, bbox_to_anchor=None, bbox_transform=None, **kwargs)
```

Bases: [matplotlib.offsetbox.OffsetBox](#)

An offset box placed according to location *loc*.

AnchoredOffsetbox has a single child. When multiple children are needed, use an extra OffsetBox to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the *bbox\_to\_anchor*.

### Parameters

#### **loc**

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of [Legend](#) for details.

**pad**

[float, default: 0.4] Padding around the child as fraction of the fontsize.

**borderpad**

[float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child**

[*OffsetBox*] The box that will be anchored.

**prop**

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon**

[bool] Whether to draw a frame around the box.

**bbox\_to\_anchor**

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform**

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs**

All other parameters are passed on to *OffsetBox*.

## Notes

See [Legend](#) for a detailed description of the anchoring mechanism.

```
codes = {'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8}
```

**draw(self, renderer)**

Update the location of children if necessary and draw them to the given *renderer*.

**get\_bbox\_to\_anchor(self)**

Return the bbox that the box is anchored to.

**get\_child(self)**

Return the child.

**get\_children(self)**

Return the list of children.

**get\_extent(self, renderer)**

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

---

**get\_window\_extent** (*self, renderer*)  
 Return the bounding box in display space.

**set\_bbox\_to\_anchor** (*self, bbox, transform=None*)  
 Set the bbox that the box is anchored to.  
*bbox* can be a Bbox instance, a list of [left, bottom, width, height], or a list of [left, bottom] where the width and height will be assumed to be zero. The bbox will be transformed to display coordinate by the given transform.

**set\_child** (*self, child*)  
 Set the child to be anchored.

**update\_frame** (*self, bbox, fontsize=None*)  
**zorder = 5**

**class** matplotlib.offsetbox.AnchoredText (*s, loc, pad=0.4, borderpad=0.5, prop=None, \*\*kwargs*)  
 Bases: *matplotlib.offsetbox.AnchoredOffsetbox*  
 AnchoredOffsetbox with Text.

**Parameters**

**s**  
 [str] Text.

**loc**  
 [str] Location code. See *AnchoredOffsetbox*.

**pad**  
 [float, default: 0.4] Padding around the text as fraction of the fontsize.

**borderpad**  
 [float, default: 0.5] Spacing between the offsetbox frame and the *bbox\_to\_anchor*.

**prop**  
 [dict, optional] Dictionary of keyword parameters to be passed to the *Text* instance contained inside AnchoredText.

**\*\*kwargs**  
 All other parameters are passed to *AnchoredOffsetbox*.

**class** matplotlib.offsetbox.AnnotationBbox (*offsetbox, xy, xybox=None, xycoords='data', boxcoords=None, frameon=True, pad=0.4, annotation\_clip=None, box\_alignment=0.5, bboxprops=None, arrowprops=None, fontsize=None, \*\*kwargs*)

Bases: `matplotlib.artist.Artist`, `matplotlib.text._AnnotationBase`

Container for an `OffsetBox` referring to a specific position `xy`.

Optionally an arrow pointing from the offsetbox to `xy` can be drawn.

This is like `Annotation`, but with `OffsetBox` instead of `Text`.

### Parameters

#### `offsetbox`

[`OffsetBox`]

#### `xy`

[(float, float)] The point  $(x, y)$  to annotate. The coordinate system is determined by `xycoords`.

#### `xybox`

[(float, float), default: `xy`] The position  $(x, y)$  to place the text at. The coordinate system is determined by `boxcoords`.

#### `xycoords`

[str or `Artist` or `Transform` or callable or (float, float), default: 'data'] The coordinate system that `xy` is given in. See the parameter `xycoords` in `Annotation` for a detailed description.

#### `boxcoords`

[str or `Artist` or `Transform` or callable or (float, float), default: value of `xycoords`] The coordinate system that `xybox` is given in. See the parameter `textcoords` in `Annotation` for a detailed description.

#### `frameon`

[bool, default: True] Whether to draw a frame around the box.

#### `pad`

[float, default: 0.4] Padding around the offsetbox.

#### `box_alignment`

[(float, float)] A tuple of two floats for a vertical and horizontal alignment of the offset box w.r.t. the `boxcoords`. The lower-left corner is  $(0, 0)$  and upper-right corner is  $(1, 1)$ .

#### `**kwargs`

Other parameters are identical to `Annotation`.

### `property anncoords`

#### `contains` (`self, mouseevent`)

Test whether the artist contains the mouse event.

## Parameters

### mouseevent

[`matplotlib.backend_bases.MouseEvent`]

## Returns

### contains

[bool] Whether any values are within the radius.

### details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

### draw(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

## Parameters

### renderer

[`RendererBase` subclass.]

## Notes

This method is overridden in the Artist subclasses.

### get\_children(*self*)

Return a list of the child `Artists` of this `Artist`.

### get\_fontsize(*self, s=<deprecated parameter>*)

Return the fontsize in points.

### get\_tightbbox(*self, renderer*)

get tight bounding box in display space.

### get\_window\_extent(*self, renderer*)

get the bounding box in display space.

### set\_figure(*self, fig*)

Set the `Figure` instance the artist belongs to.

## Parameters

### fig

[`Figure`]

**set\_fontsize**(*self*, *s=None*)

Set the fontsize in points.

If *s* is not given, reset to `rcParams["legend.fontsize"]` (default: 'medium').**update\_positions**(*self*, *renderer*)

Update the pixel positions of the annotated point and the text.

**property xyann****zorder = 3****class** `matplotlib.offsetbox.AuxTransformBox`(*aux\_transform*)Bases: `matplotlib.offsetbox.OffsetBox`

Offset Box with the aux\_transform. Its children will be transformed with the aux\_transform first then will be offsetted. The absolute coordinate of the aux\_transform is meaning as it will be automatically adjust so that the left-lower corner of the bounding box of children will be set to (0, 0) before the offset transform.

It is similar to drawing area, except that the extent of the box is not predetermined but calculated from the window extent of its children. Furthermore, the extent of the children will be calculated in the transformed coordinate.

**add\_artist**(*self*, *a*)Add an `Artist` to the container box.**draw**(*self*, *renderer*)Update the location of children if necessary and draw them to the given *renderer*.**get\_extent**(*self*, *renderer*)

Return a tuple width, height, xdescent, ydescent of the box.

**get\_offset**(*self*)

Return offset of the container.

**get\_transform**(*self*)Return the `Transform` applied to the children**get\_window\_extent**(*self*, *renderer*)

Return the bounding box in display space.

**set\_offset**(*self*, *xy*)

Set the offset of the container.

## Parameters

**xy**

[(float, float)] The (x, y) coordinates of the offset in display units.

**set\_transform**(*self*, *t*)

set\_transform is ignored.

**class** `matplotlib.offsetbox.DraggableAnnotation`(*annotation*, *use\_blit=False*)Bases: `matplotlib.offsetbox.DraggableBase`

---

```
save_offset(self)
update_offset(self, dx, dy)

class matplotlib.offsetbox.DraggableBase(ref_artist, use_blit=False)
Bases: object
```

Helper base class for a draggable artist (legend, offsetbox).

Derived classes must override the following methods:

```
def save_offset(self):
    """
    Called when the object is picked for dragging; should save the
    reference position of the artist.
    """

def update_offset(self, dx, dy):
    """
    Called during the dragging; (*dx*, *dy*) is the pixel offset from
    the point where the mouse drag started.
    """
```

Optionally, you may override the following method:

```
def finalize_offset(self):
    """Called when the mouse is released."""
```

In the current implementation of *DraggableLegend* and *DraggableAnnotation*, *update\_offset* places the artists in display coordinates, and *finalize\_offset* recalculates their position in axes coordinate and set a relevant attribute.

```
artist_picker(self, artist, evt)
[Deprecated]
```

## Notes

Deprecated since version 3.3:

```
disconnect(self)
Disconnect the callbacks.

finalize_offset(self)

on_motion(self, evt)

on_motion_blit(self, evt)
[Deprecated]
```

## Notes

Deprecated since version 3.3:

`on_pick(self, evt)`  
`on_release(self, event)`  
`save_offset(self)`  
`update_offset(self, dx, dy)`

`class matplotlib.offsetbox.DraggableOffsetBox(ref_artist, offsetbox, use_blt=False)`  
Bases: `matplotlib.offsetbox.DraggableBase`  
`get_loc_in_canvas(self)`  
`save_offset(self)`  
`update_offset(self, dx, dy)`

`class matplotlib.offsetbox.DrawingArea(width, height, xdescent=0.0, ydescent=0.0, clip=False)`  
Bases: `matplotlib.offsetbox.OffsetBox`

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.

## Parameters

### `width, height`

[float] Width and height of the container box.

### `xdescent, ydescent`

[float] Descent of the box in x- and y-direction.

### `clip`

[bool] Whether to clip the children to the box.

### `add_artist(self, a)`

Add an `Artist` to the container box.

### `property clip_children`

If the children of this DrawingArea should be clipped by DrawingArea bounding box.

### `draw(self, renderer)`

Update the location of children if necessary and draw them to the given `renderer`.

### `get_extent(self, renderer)`

Return width, height, xdescent, ydescent of box.

### `get_offset(self)`

Return offset of the container.

---

**get\_transform**(*self*)  
Return the *Transform* applied to the children.

**get\_window\_extent**(*self, renderer*)  
Return the bounding box in display space.

**set\_offset**(*self, xy*)  
Set the offset of the container.

**Parameters****xy**

[(float, float)] The (x, y) coordinates of the offset in display units.

**set\_transform**(*self, t*)  
set\_transform is ignored.

**class** matplotlib.offsetbox.HPacker(*pad=None, sep=None, width=None, height=None, align='baseline', mode='fixed', children=None*)

Bases: *matplotlib.offsetbox.PackerBase*

HPacker packs its children horizontally, automatically adjusting their relative positions at draw time.

**Parameters****pad**

[float, optional] The boundary padding in points.

**sep**

[float, optional] The spacing between items in points.

**width, height**

[float, optional] Width and height of the container box in pixels, calculated if *None*.

**align**

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}, default: 'baseline'] Alignment of boxes.

**mode**

[{'fixed', 'expand', 'equal'}, default: 'fixed'] The packing mode.

- 'fixed' packs the given *Artists* tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

**children**

[list of [Artist](#)] The artists to pack.

**Notes**

*pad* and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

**get\_extent\_offsets (self, renderer)**

Update offset of the children and return the extent of the box.

**Parameters****renderer**

[[RendererBase](#) subclass]

**Returns****width****height****xdescent****ydescent****list of (xoffset, yoffset) pairs****class matplotlib.offsetbox.OffsetBox (\*args, \*\*kwargs)**

Bases: [matplotlib.artist.Artist](#)

The OffsetBox is a simple container artist.

The child artists are meant to be drawn at a relative position to its parent.

Being an artist itself, all parameters are passed on to [Artist](#).

**property axes**

The [Axes](#) instance the artist resides in, or *None*.

**contains (self, mouseevent)**

Delegate the mouse event contains-check to the children.

As a container, the [OffsetBox](#) does not respond itself to mouseevents.

**Parameters****mouseevent**

[[matplotlib.backend\\_bases.MouseEvent](#)]

**Returns**

**contains**

[bool] Whether any values are within the radius.

**details**

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

**See also:**

[\*Artist.contains\*](#)

**draw** (*self, renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

**get\_children** (*self*)

Return a list of the child [\*Artists\*](#).

**get\_extent** (*self, renderer*)

Return a tuple *width, height, xdescent, ydescent* of the box.

**get\_extent\_offsets** (*self, renderer*)

Update offset of the children and return the extent of the box.

**Parameters****renderer**

[[\*RendererBase\*](#) subclass]

**Returns**

**width**

**height**

**xdescent**

**ydescent**

**list of (xoffset, yoffset) pairs**

**get\_offset** (*self, width, height, xdescent, ydescent, renderer*)

Return the offset as a tuple (x, y).

The extent parameters have to be provided to handle the case where the offset is dynamically determined by a callable (see [\*set\\_offset\*](#)).

**Parameters**

**width, height, xdescent, ydescent**

Extent parameters.

**renderer**

[*RendererBase* subclass]

**get\_visible\_children**(*self*)

Return a list of the visible child *Artist*s.

**get\_window\_extent**(*self, renderer*)

Return the bounding box (*Bbox*) in display space.

**set\_figure**(*self, fig*)

Set the *Figure* for the *OffsetBox* and all its children.

**Parameters****fig**

[*Figure*]

**set\_height**(*self, height*)

Set the height of the box.

**Parameters****height**

[float]

**set\_offset**(*self, xy*)

Set the offset.

**Parameters****xy**

[(float, float) or callable] The (x, y) coordinates of the offset in display units. These can either be given explicitly as a tuple (x, y), or by providing a function that converts the extent into the offset. This function must have the signature:

```
def offset(width, height, xdescent, ydescent, renderer) -> (float, float)
```

**set\_width**(*self, width*)

Set the width of the box.

**Parameters****width**

[float]

---

```

class matplotlib.offsetbox.OffsetImage(arr, zoom=1, cmap=None, norm=None,
                                         interpolation=None, origin=None,
                                         filternorm=True, filterrad=4.0, resample=False, dpi_cor=True, **kwargs)
Bases: matplotlib.offsetbox.OffsetBox

draw(self, renderer)
    Update the location of children if necessary and draw them to the given renderer.

get_children(self)
    Return a list of the child Artists.

get_data(self)

get_extent(self, renderer)
    Return a tuple width, height, xdescent, ydescent of the box.

get_offset(self)
    Return offset of the container.

get_window_extent(self, renderer)
    Return the bounding box in display space.

get_zoom(self)

set_data(self, arr)

set_zoom(self, zoom)

class matplotlib.offsetbox.PackerBase(pad=None, sep=None, width=None,
                                         height=None, align='baseline',
                                         mode='fixed', children=None)
Bases: matplotlib.offsetbox.OffsetBox

```

## Parameters

### **pad**

[float, optional] The boundary padding in points.

### **sep**

[float, optional] The spacing between items in points.

### **width, height**

[float, optional] Width and height of the container box in pixels, calculated if *None*.

### **align**

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}, default: 'baseline'] Alignment of boxes.

### **mode**

[{'fixed', 'expand', 'equal'}, default: 'fixed'] The packing mode.

- 'fixed' packs the given *Artists* tight with *sep* spacing.

- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

**children**

[list of *Artist*] The artists to pack.

**Notes**

*pad* and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

```
class matplotlib.offsetbox.PaddedBox(child, pad=None, draw_frame=False,
                                      patch attrs=None)
```

Bases: *matplotlib.offsetbox.OffsetBox*

A container to add a padding around an *Artist*.

The *PaddedBox* contains a *FancyBboxPatch* that is used to visualize it when rendering.

**Parameters****child**

[*Artist*] The contained *Artist*.

**pad**

[float] The padding in points. This will be scaled with the renderer dpi. In contrast *width* and *height* are in *pixels* and thus not scaled.

**draw\_frame**

[bool] Whether to draw the contained *FancyBboxPatch*.

**patch attrs**

[dict or None] Additional parameters passed to the contained *FancyBboxPatch*.

**draw(self, renderer)**

Update the location of children if necessary and draw them to the given *renderer*.

**draw\_frame(self, renderer)****get\_extent\_offsets(self, renderer)**

Update offset of the children and return the extent of the box.

**Parameters****renderer**

[*RendererBase* subclass]

## Returns

**width**  
**height**  
**xdescent**  
**ydescent**  
**list of (xoffset, yoffset) pairs**

**update\_frame** (*self, bbox, fontsize=None*)

**class** `matplotlib.offsetbox.TextArea` (*s, textprops=None, multilinebaseline=False, minimumdescent=<deprecated parameter>*)  
Bases: `matplotlib.offsetbox.OffsetBox`

The `TextArea` is a container artist for a single `Text` instance.

The text is placed at (0, 0) with baseline+left alignment, by default. The width and height of the `TextArea` instance is the width and height of its child text.

## Parameters

**s**

[str] The text to be displayed.

**textprops**

[dict, default: {}] Dictionary of keyword parameters to be passed to the `Text` instance in the `TextArea`.

**multilinebaseline**

[bool, default: False] Whether the baseline for multiline text is adjusted so that it is (approximately) center-aligned with single-line text.

**minimumdescent**

[bool, default: True] If `True`, the box has a minimum descent of "p". This is now effectively always True.

**draw** (*self, renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

**get\_extent** (*self, renderer*)

Return a tuple `width, height, xdescent, ydescent` of the box.

**get\_minimumdescent** (*self*)

[Deprecated] Get `minimumdescent`.

## Notes

Deprecated since version 3.4.

**get\_multilinebaseline** (*self*)

Get multilinebaseline.

**get\_offset** (*self*)

Return offset of the container.

**get\_text** (*self*)

Return the string representation of this area's text.

**get\_window\_extent** (*self, renderer*)

Return the bounding box in display space.

**set\_minimumdescent** (*self, t*)

[*Deprecated*] Set minimumdescent.

If True, extent of the single line text is adjusted so that its descent is at least the one of the glyph "p".

## Notes

Deprecated since version 3.4.

**set\_multilinebaseline** (*self, t*)

Set multilinebaseline.

If True, the baseline for multiline text is adjusted so that it is (approximately) center-aligned with single-line text. This is used e.g. by the legend implementation so that single-line labels are baseline-aligned, but multiline labels are "center"-aligned with them.

**set\_offset** (*self, xy*)

Set the offset of the container.

## Parameters

**xy**

[(float, float)] The (x, y) coordinates of the offset in display units.

**set\_text** (*self, s*)

Set the text of this area as a string.

**set\_transform** (*self, t*)

set\_transform is ignored.

**class** matplotlib.offsetbox.**VPack** (*pad=None, sep=None, width=None, height=None, align='baseline', mode='fixed', children=None*)

Bases: *matplotlib.offsetbox.PackerBase*

VPack packs its children vertically, automatically adjusting their relative positions at draw time.

## Parameters

### pad

[float, optional] The boundary padding in points.

### sep

[float, optional] The spacing between items in points.

### width, height

[float, optional] Width and height of the container box in pixels, calculated if *None*.

### align

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}, default: 'baseline'] Alignment of boxes.

### mode

[{'fixed', 'expand', 'equal'}, default: 'fixed'] The packing mode.

- 'fixed' packs the given *Artists* tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

### children

[list of *Artist*] The artists to pack.

## Notes

*pad* and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

### get\_extent\_offsets (self, renderer)

Update offset of the children and return the extent of the box.

## Parameters

### renderer

[*RendererBase* subclass]

## Returns

### width

### height

### xdescent

`ydescent`

`list of (xoffset, yoffset) pairs`

`matplotlib.offsetbox.bbox_artist(*args, **kwargs)`

## 18.36 matplotlib.patches

### 18.36.1 Classes

<code>Arc(xy, width, height[, angle, theta1, theta2])</code>	An elliptical arc, i.e. a segment of an ellipse.
<code>Arrow(x, y, dx, dy[, width])</code>	An arrow patch.
<code>ArrowStyle(stylename, **kw)</code>	<code>ArrowStyle</code> is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path.
<code>BoxStyle(stylename, **kw)</code>	<code>BoxStyle</code> is a container class which defines several boxstyle classes, which are used for <code>FancyBoxPatch</code> .
<code>Circle(xy[, radius])</code>	A circle patch.
<code>CirclePolygon(xy[, radius, resolution])</code>	A polygon-approximation of a circle patch.
<code>ConnectionPatch(xyA, xyB, coordsA[, ...])</code>	A patch that connects two points (possibly in different axes).
<code>ConnectionStyle(stylename, **kw)</code>	<code>ConnectionStyle</code> is a container class which defines several connectionstyle classes, which is used to create a path between two points.
<code>Ellipse(xy, width, height[, angle])</code>	A scale-free ellipse.
<code>FancyArrow(x, y, dx, dy[, width, ...])</code>	Like Arrow, but lets you set head width and head height independently.
<code>FancyArrowPatch([posA, posB, path, ...])</code>	A fancy arrow patch.
<code>FancyBoxPatch(xy, width, height[, ...])</code>	A fancy box around a rectangle with lower left at $xy = (x, y)$ with specified width and height.
<code>Patch([edgecolor, facecolor, color, ...])</code>	A patch is a 2D artist with a face color and an edge color.
<code>PathPatch(path, **kwargs)</code>	A general polycurve path patch.
<code>StepPatch(values, edges, *[, orientation, ...])</code>	A path patch describing a stepwise constant function.
<code>Polygon(xy[, closed])</code>	A general polygon patch.
<code>Rectangle(xy, width, height[, angle])</code>	A rectangle defined via an anchor point $xy$ and its <code>width</code> and <code>height</code> .
<code>RegularPolygon(xy, numVertices[, radius, ...])</code>	A regular polygon patch.
<code>Shadow(patch, ox, oy[, props])</code>	Create a shadow of the given <code>patch</code> .
<code>Wedge(center, r, theta1, theta2[, width])</code>	Wedge shaped patch.

## matplotlib.patches.Arc

```
class matplotlib.patches.Arc(xy, width, height, angle=0.0, theta1=0.0, theta2=360.0,
                               **kwargs)
Bases: matplotlib.patches.Ellipse
```

An elliptical arc, i.e. a segment of an ellipse.

Due to internal optimizations, there are certain restrictions on using Arc:

- The arc cannot be filled.
- The arc must be used in an [Axes](#) instance. It can not be added directly to a [Figure](#) because it is optimized to only render the segments that are inside the axes bounding box with high resolution.

### Parameters

#### xy

[float, float] The center of the ellipse.

#### width

[float] The length of the horizontal axis.

#### height

[float] The length of the vertical axis.

#### angle

[float] Rotation of the ellipse in degrees (counterclockwise).

#### theta1, theta2

[float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

### Other Parameters

#### \*\*kwargs

[[Patch](#) properties] Most [Patch](#) properties are supported as keyword arguments, with the exception of *fill* and *facecolor* because filling is not supported.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool

continues on next page

Table 154 – continued from previous page

Property	Description
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, xy, width, height, angle=0.0, theta1=0.0, theta2=360.0, **kwargs)`

#### Parameters

##### `xy`

[float, float] The center of the ellipse.

##### `width`

[float] The length of the horizontal axis.

##### `height`

[float] The length of the vertical axis.

##### `angle`

[float] Rotation of the ellipse in degrees (counterclockwise).

##### `theta1, theta2`

[float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

## Other Parameters

### \*\*kwargs

[*Patch* properties] Most *Patch* properties are supported as keyword arguments, with the exception of *fill* and *facecolor* because filling is not supported.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or ls	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<i>linewidth</i> or lw	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'  
  
__str__(self)  
    Return str(self).  
  
draw(self, renderer)  
    Draw the arc to the given renderer.
```

### Notes

Ellipses are normally drawn using an approximation that uses eight cubic Bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

Lancaster, Don. *Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines*.

<https://www.tinaja.com/glib/ellipse4.pdf>

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes bounding box are located. (This is done by performing an inverse transformation on the axes bbox such that it is relative to the unit circle -- this makes the intersection calculation much easier than doing rotated ellipse intersection directly).

This uses the "line intersecting a circle" algorithm from:

Vince, John. *Geometry for Computer Graphics: Formulae, Examples & Proofs*.  
London: Springer-Verlag, 2005.

2. The angles of each of the intersection points are calculated.
3. Proceeding counterclockwise starting in the positive x-direction, each of the visible arc-segments between the pairs of vertices are drawn using the Bezier arc approximation technique implemented in `Path.arc`.

### Examples using `matplotlib.patches.Arc`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_angle\_annotation.py
- sphx\_glr\_gallery\_units\_ellipse\_with\_units.py
- *Sample plots in Matplotlib*

**matplotlib.patches.Arrow**

```
class matplotlib.patches.Arrow(x, y, dx, dy, width=1.0, **kwargs)
```

Bases: *matplotlib.patches.Patch*

An arrow patch.

Draws an arrow from  $(x, y)$  to  $(x + dx, y + dy)$ . The width of the arrow is scaled by *width*.

**Parameters**

**x**

[float] x coordinate of the arrow tail.

**y**

[float] y coordinate of the arrow tail.

**dx**

[float] Arrow length in the x direction.

**dy**

[float] Arrow length in the y direction.

**width**

[float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.

**\*\*kwargs**

Keyword arguments control the *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}

continues on next page

Table 156 – continued from previous page

Property	Description
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**See also:*****FancyArrow***

Patch that allows independent control of the head and tail properties.

**`__init__(self, x, y, dx, dy, width=1.0, **kwargs)`**

Draws an arrow from  $(x, y)$  to  $(x + dx, y + dy)$ . The width of the arrow is scaled by `width`.

**Parameters****x**

[float] x coordinate of the arrow tail.

**y**

[float] y coordinate of the arrow tail.

**dx**

[float] Arrow length in the x direction.

**dy**

[float] Arrow length in the y direction.

**width**

[float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.

**\*\*kwargs**

Keyword arguments control the `Patch` properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**See also:****`FancyArrow`**

Patch that allows independent control of the head and tail properties.

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)
```

Return str(self).

```
get_patch_transform(self)
```

Return the `Transform` instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate)

by 5.

### `get_path(self)`

Return the path of this patch.

## Examples using `matplotlib.patches.Arrow`

- sphx\_glr\_gallery\_shapes\_and\_collections\_arrow\_guide.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py

## `matplotlib.patches.ArrowStyle`

`class matplotlib.patches.ArrowStyle(stylename, **kw)`

Bases: `matplotlib.patches._Style`

`ArrowStyle` is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with `FancyArrowPatch`.

A arrowstyle object can be either created as:

```
ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy, head_length=.4, head_width=.4, tail_width=.4")
```

The following classes are defined

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	- [	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	-   >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	<   -	head_length=0.4, head_width=0.2
Curve-FilledAB	<   -   >	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	sim-ple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

An instance of any arrow style class is a callable object, whose call signature is:

```
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a `Path` instance and a boolean value. `path` is a `Path` instance along which the arrow will be drawn. `mutation_size` and `aspect_ratio` have the same meaning as in `BoxStyle`. `linewidth` is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.

Return the instance of the subclass with the given style name.

```
class BarAB(widthA=1.0, angleA=None, widthB=1.0, angleB=None)
    Bases: matplotlib.patches.ArrowStyle._Bracket
```

An arrow with vertical bars | at both ends.

#### Parameters

##### widthA

[float, default: 1.0] Width of the bracket.

##### angleA

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

##### widthB

[float, default: 1.0] Width of the bracket.

**angleB**

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

**\_\_init\_\_(self, widthA=1.0, angleA=None, widthB=1.0, angleB=None)**

**Parameters****widthA**

[float, default: 1.0] Width of the bracket.

**angleA**

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

**widthB**

[float, default: 1.0] Width of the bracket.

**angleB**

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

**\_\_module\_\_ = 'matplotlib.patches'**

**class BracketA(widthA=1.0, lengthA=0.2, angleA=None)**

Bases: matplotlib.patches.ArrowStyle.\_Bracket

An arrow with an outward square bracket at its start.

**Parameters****widthA**

[float, default: 1.0] Width of the bracket.

**lengthA**

[float, default: 0.2] Length of the bracket.

**angleA**

[float, default: None] Angle between the bracket and the line.

**\_\_init\_\_(self, widthA=1.0, lengthA=0.2, angleA=None)**

**Parameters****widthA**

[float, default: 1.0] Width of the bracket.

**lengthA**

[float, default: 0.2] Length of the bracket.

**angleA**

[float, default: None] Angle between the bracket and the line.

**\_\_module\_\_ = 'matplotlib.patches'**

```
class BracketAB(widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2,
                 angleB=None)
```

Bases: matplotlib.patches.ArrowStyle.\_Bracket

An arrow with outward square brackets at both ends.

### Parameters

#### widthA

[float, default: 1.0] Width of the bracket.

#### lengthA

[float, default: 0.2] Length of the bracket.

#### angleA

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

#### widthB

[float, default: 1.0] Width of the bracket.

#### lengthB

[float, default: 0.2] Length of the bracket.

#### angleB

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

```
__init__(self, widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, an-
```

```
gleB=None)
```

### Parameters

#### widthA

[float, default: 1.0] Width of the bracket.

#### lengthA

[float, default: 0.2] Length of the bracket.

#### angleA

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

#### widthB

[float, default: 1.0] Width of the bracket.

#### lengthB

[float, default: 0.2] Length of the bracket.

#### angleB

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

```
__module__ = 'matplotlib.patches'

class BracketB(widthB=1.0, lengthB=0.2, angleB=None)
    Bases: matplotlib.patches.ArrowStyle._Bracket

    An arrow with an outward square bracket at its end.
```

**Parameters****widthB**

[float, default: 1.0] Width of the bracket.

**lengthB**

[float, default: 0.2] Length of the bracket.

**angleB**

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

```
__init__(self, widthB=1.0, lengthB=0.2, angleB=None)
```

**Parameters****widthB**

[float, default: 1.0] Width of the bracket.

**lengthB**

[float, default: 0.2] Length of the bracket.

**angleB**

[float, default: None] Angle, in degrees, between the bracket and the line. Zero is perpendicular to the line, and positive measures counterclockwise.

```
__module__ = 'matplotlib.patches'
```

**class Curve**

Bases: matplotlib.patches.ArrowStyle.\_Curve

A simple curve without any arrow head.

The arrows are drawn if *beginarrow* and/or *endarrow* are true. *head\_length* and *head\_width* determines the size of the arrow relative to the *mutation scale*. The arrowhead at the begin (or end) is closed if *fillbegin* (or *fillend*) is True.

```
__init__(self)
```

The arrows are drawn if *beginarrow* and/or *endarrow* are true. *head\_length* and *head\_width* determines the size of the arrow relative to the *mutation scale*. The arrowhead at the begin (or end) is closed if *fillbegin* (or *fillend*) is True.

```
__module__ = 'matplotlib.patches'
```

**class CurveA**(head\_length=0.4, head\_width=0.2)

Bases: matplotlib.patches.ArrowStyle.\_Curve

An arrow with a head at its begin point.

---

## Parameters

### **head\_length**

[float, default: 0.4] Length of the arrow head.

### **head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_init\_\_(self, head\_length=0.4, head\_width=0.2)**

### Parameters

#### **head\_length**

[float, default: 0.4] Length of the arrow head.

#### **head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_module\_\_ = 'matplotlib.patches'**

**class CurveAB(head\_length=0.4, head\_width=0.2)**

Bases: matplotlib.patches.ArrowStyle.\_Curve

An arrow with heads both at the begin and the end point.

## Parameters

### **head\_length**

[float, default: 0.4] Length of the arrow head.

### **head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_init\_\_(self, head\_length=0.4, head\_width=0.2)**

### Parameters

#### **head\_length**

[float, default: 0.4] Length of the arrow head.

#### **head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_module\_\_ = 'matplotlib.patches'**

**class CurveB(head\_length=0.4, head\_width=0.2)**

Bases: matplotlib.patches.ArrowStyle.\_Curve

An arrow with a head at its end point.

## Parameters

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_init\_\_(self, head\_length=0.4, head\_width=0.2)**

**Parameters**

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_module\_\_ = 'matplotlib.patches'**

**class CurveFilledA(head\_length=0.4, head\_width=0.2)**

Bases: matplotlib.patches.ArrowStyle.\_Curve

An arrow with filled triangle head at the begin.

**Parameters**

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_init\_\_(self, head\_length=0.4, head\_width=0.2)**

**Parameters**

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_module\_\_ = 'matplotlib.patches'**

**class CurveFilledAB(head\_length=0.4, head\_width=0.2)**

Bases: matplotlib.patches.ArrowStyle.\_Curve

An arrow with filled triangle heads at both ends.

**Parameters**

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_init\_\_(self, head\_length=0.4, head\_width=0.2)**  
**Parameters**

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_module\_\_ = 'matplotlib.patches'**

**class CurveFilledB(head\_length=0.4, head\_width=0.2)**  
Bases: matplotlib.patches.ArrowStyle.\_Curve

An arrow with filled triangle head at the end.

**Parameters****head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_init\_\_(self, head\_length=0.4, head\_width=0.2)**  
**Parameters**

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.2] Width of the arrow head.

**\_\_module\_\_ = 'matplotlib.patches'**

**class Fancy(head\_length=0.4, head\_width=0.4, tail\_width=0.4)**  
Bases: matplotlib.patches.ArrowStyle.\_Base

A fancy arrow. Only works with a quadratic Bezier curve.

**Parameters****head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.4] Width of the arrow head.

**tail\_width**

[float, default: 0.4] Width of the arrow tail.

**\_\_init\_\_(self, head\_length=0.4, head\_width=0.4, tail\_width=0.4)**  
**Parameters**

**head\_length**

[float, default: 0.4] Length of the arrow head.

**head\_width**

[float, default: 0.4] Width of the arrow head.

**tail\_width**

[float, default: 0.4] Width of the arrow tail.

**\_\_module\_\_ = 'matplotlib.patches'**

**transmute(self, path, mutation\_size, linewidth)**

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation\_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

**class Simple(head\_length=0.5, head\_width=0.5, tail\_width=0.2)**

Bases: matplotlib.patches.ArrowStyle.\_Base

A simple arrow. Only works with a quadratic Bezier curve.

**Parameters****head\_length**

[float, default: 0.5] Length of the arrow head.

**head\_width**

[float, default: 0.5] Width of the arrow head.

**tail\_width**

[float, default: 0.2] Width of the arrow tail.

**\_\_init\_\_(self, head\_length=0.5, head\_width=0.5, tail\_width=0.2)**  
**Parameters**

**head\_length**

[float, default: 0.5] Length of the arrow head.

**head\_width**

[float, default: 0.5] Width of the arrow head.

**tail\_width**

[float, default: 0.2] Width of the arrow tail.

**\_\_module\_\_** = 'matplotlib.patches'

**transmute**(*self, path, mutation\_size, linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation\_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

**class Wedge**(*tail\_width=0.3, shrink\_factor=0.5*)

Bases: matplotlib.patches.ArrowStyle.\_Base

Wedge(?) shape. Only works with a quadratic Bezier curve. The begin point has a width of the tail\_width and the end point has a width of 0. At the middle, the width is shrink\_factor\*tail\_width.

**Parameters****tail\_width**

[float, default: 0.3] Width of the tail.

**shrink\_factor**

[float, default: 0.5] Fraction of the arrow width at the middle point.

**\_\_init\_\_**(*self, tail\_width=0.3, shrink\_factor=0.5*)

**Parameters****tail\_width**

[float, default: 0.3] Width of the tail.

**shrink\_factor**

[float, default: 0.5] Fraction of the arrow width at the middle point.

**\_\_module\_\_** = 'matplotlib.patches'

**transmute**(*self, path, mutation\_size, linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation\_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

**\_\_module\_\_** = 'matplotlib.patches'

### Examples using `matplotlib.patches.ArrowStyle`

#### `matplotlib.patches.BoxStyle`

```
class matplotlib.patches.BoxStyle(stylename, **kw)
```

Bases: `matplotlib.patches._Style`

`BoxStyle` is a container class which defines several boxstyle classes, which are used for `FancyBboxPatch`.

A style object can be created as:

```
BoxStyle.Round(pad=0.2)
```

or:

```
BoxStyle("Round", pad=0.2)
```

or:

```
BoxStyle("Round", pad=0.2")
```

The following boxstyle classes are defined.

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

An instance of any boxstyle class is an callable object, whose call signature is:

```
__call__(self, x0, y0, width, height, mutation_size)
```

and returns a `Path` instance. `x0`, `y0`, `width` and `height` specify the location and size of the box to be drawn. `mutation_size` determines the overall size of the mutation (by which I mean the transformation of the rectangle to the fancy box).

Return the instance of the subclass with the given style name.

```
class Circle(pad=0.3)
```

Bases: `matplotlib.patches.BoxStyle._Base`

A circular box.

#### Parameters

**pad**

[float, default: 0.3] The amount of padding around the original box.

**\_\_call\_\_** (*self*, *x0*, *y0*, *width*, *height*, *mutation\_size*, *mutation\_aspect*=*<deprecated parameter>*)

Given the location and size of the box, return the path of the box around it.

**Parameters****x0, y0, width, height**

[float] Location and size of the box.

**mutation\_size**

[float] A reference scale for the mutation.

**Returns****Path**

**\_\_init\_\_** (*self*, *pad*=0.3)

**Parameters****pad**

[float, default: 0.3] The amount of padding around the original box.

**\_\_module\_\_** = 'matplotlib.patches'

**class DArrow** (*pad*=0.3)

Bases: matplotlib.patches.BoxStyle.\_Base

A box in the shape of a two-way arrow.

**Parameters****pad**

[float, default: 0.3] The amount of padding around the original box.

**\_\_call\_\_** (*self*, *x0*, *y0*, *width*, *height*, *mutation\_size*, *mutation\_aspect*=*<deprecated parameter>*)

Given the location and size of the box, return the path of the box around it.

**Parameters****x0, y0, width, height**

[float] Location and size of the box.

**mutation\_size**

[float] A reference scale for the mutation.

**Returns****Path**

**\_\_init\_\_** (*self*, *pad*=0.3)

**Parameters**

**pad**

[float, default: 0.3] The amount of padding around the original box.

```
__module__ = 'matplotlib.patches'  
class LArrow(pad=0.3)  
    Bases: matplotlib.patches.BoxStyle._Base  
    A box in the shape of a left-pointing arrow.
```

**Parameters****pad**

[float, default: 0.3] The amount of padding around the original box.

```
__call__(self, x0, y0, width, height, mutation_size, mutation_aspect=<deprecated parameter>)
```

Given the location and size of the box, return the path of the box around it.

**Parameters****x0, y0, width, height**

[float] Location and size of the box.

**mutation\_size**

[float] A reference scale for the mutation.

**Returns****Path**

```
__init__(self, pad=0.3)
```

**Parameters****pad**

[float, default: 0.3] The amount of padding around the original box.

```
__module__ = 'matplotlib.patches'
```

```
class RArrow(pad=0.3)
```

Bases: *matplotlib.patches.BoxStyle.LArrow*

A box in the shape of a right-pointing arrow.

**Parameters****pad**

[float, default: 0.3] The amount of padding around the original box.

```
__call__(self, x0, y0, width, height, mutation_size, mutation_aspect=<deprecated parameter>)
```

Given the location and size of the box, return the path of the box around it.

**Parameters**

**x0, y0, width, height**

[float] Location and size of the box.

**mutation\_size**

[float] A reference scale for the mutation.

**Returns**

*Path*

```
__module__ = 'matplotlib.patches'

class Round(pad=0.3, rounding_size=None)
    Bases: matplotlib.patches.BoxStyle._Base
    A box with round corners.
```

**Parameters**

**pad**

[float, default: 0.3] The amount of padding around the original box.

**rounding\_size**

[float, default: *pad*] Radius of the corners.

```
__call__(self, x0, y0, width, height, mutation_size, mutation_aspect=<deprecated parameter>)
```

Given the location and size of the box, return the path of the box around it.

**Parameters**

**x0, y0, width, height**

[float] Location and size of the box.

**mutation\_size**

[float] A reference scale for the mutation.

**Returns**

*Path*

```
__init__(self, pad=0.3, rounding_size=None)
```

**Parameters**

**pad**

[float, default: 0.3] The amount of padding around the original box.

**rounding\_size**

[float, default: *pad*] Radius of the corners.

```
__module__ = 'matplotlib.patches'
```

```
class Round4(pad=0.3, rounding_size=None)
```

Bases: matplotlib.patches.BoxStyle.\_Base

A box with rounded edges.

## Parameters

### **pad**

[float, default: 0.3] The amount of padding around the original box.

### **rounding\_size**

[float, default:  $pad/2$ ] Rounding of edges.

**\_\_call\_\_** (*self*, *x0*, *y0*, *width*, *height*, *mutation\_size*, *mutation\_aspect*=*<deprecated parameter>*)

Given the location and size of the box, return the path of the box around it.

## Parameters

### **x0, y0, width, height**

[float] Location and size of the box.

### **mutation\_size**

[float] A reference scale for the mutation.

## Returns

### **Path**

**\_\_init\_\_** (*self*, *pad*=0.3, *rounding\_size*=None)

## Parameters

### **pad**

[float, default: 0.3] The amount of padding around the original box.

### **rounding\_size**

[float, default:  $pad/2$ ] Rounding of edges.

**\_\_module\_\_** = 'matplotlib.patches'

**class Roundtooth** (*pad*=0.3, *tooth\_size*=None)

Bases: *matplotlib.patches.BoxStyle.Sawtooth*

A box with a rounded sawtooth outline.

## Parameters

### **pad**

[float, default: 0.3] The amount of padding around the original box.

### **tooth\_size**

[float, default:  $pad/2$ ] Size of the sawtooth.

**\_\_call\_\_** (*self*, *x0*, *y0*, *width*, *height*, *mutation\_size*, *mutation\_aspect*=*<deprecated parameter>*)

Given the location and size of the box, return the path of the box around it.

## Parameters

**x0, y0, width, height**

[float] Location and size of the box.

**mutation\_size**

[float] A reference scale for the mutation.

**Returns*****Path***

```
__module__ = 'matplotlib.patches'

class Sawtooth(pad=0.3, tooth_size=None)
    Bases: matplotlib.patches.BoxStyle._Base
    A box with a sawtooth outline.
```

**Parameters****pad**

[float, default: 0.3] The amount of padding around the original box.

**tooth\_size**

[float, default: *pad*/2] Size of the sawtooth.

```
__call__(self, x0, y0, width, height, mutation_size, mutation_aspect=<deprecated parameter>)
```

Given the location and size of the box, return the path of the box around it.

**Parameters****x0, y0, width, height**

[float] Location and size of the box.

**mutation\_size**

[float] A reference scale for the mutation.

**Returns*****Path***

```
__init__(self, pad=0.3, tooth_size=None)
```

**Parameters****pad**

[float, default: 0.3] The amount of padding around the original box.

**tooth\_size**

[float, default: *pad*/2] Size of the sawtooth.

```
__module__ = 'matplotlib.patches'
```

```
class Square(pad=0.3)
```

Bases: matplotlib.patches.BoxStyle.\_Base

A square box.

## Parameters

### **pad**

[float, default: 0.3] The amount of padding around the original box.

### **\_\_call\_\_(self, x0, y0, width, height, mutation\_size, mutation\_aspect=<deprecated parameter>)**

Given the location and size of the box, return the path of the box around it.

#### Parameters

##### **x0, y0, width, height**

[float] Location and size of the box.

##### **mutation\_size**

[float] A reference scale for the mutation.

#### Returns

##### **Path**

### **\_\_init\_\_(self, pad=0.3)**

#### Parameters

##### **pad**

[float, default: 0.3] The amount of padding around the original box.

**\_\_module\_\_ = 'matplotlib.patches'**

**\_\_module\_\_ = 'matplotlib.patches'**

## Examples using `matplotlib.patches.BoxStyle`

- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py

## matplotlib.patches.Circle

**class** matplotlib.patches.Circle(xy, radius=5, \*\*kwargs)

Bases: `matplotlib.patches.Ellipse`

A circle patch.

Create a true circle at center  $xy = (x, y)$  with given  $radius$ .

Unlike `CirclePolygon` which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**`__init__(self, xy, radius=5, **kwargs)`**

Create a true circle at center `xy` = (x, y) with given `radius`.

Unlike `CirclePolygon` which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown

continues on next page

Table 159 – continued from previous page

Property	Description
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

```

__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

get_radius(self)
    Return the radius of the circle.

property radius
    Return the radius of the circle.

set_radius(self, radius)
    Set the radius of the circle.

```

### Parameters

#### radius

[float]

## `matplotlib.patches.CirclePolygon`

```
class matplotlib.patches.CirclePolygon(xy, radius=5, resolution=20, **kwargs)
Bases: matplotlib.patches.RegularPolygon
```

A polygon-approximation of a circle patch.

Create a circle at  $xy = (x, y)$  with given *radius*.

This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see *Circle*.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, xy, radius=5, resolution=20, **kwargs)`

Create a circle at  $xy = (x, y)$  with given `radius`.

This circle is approximated by a regular polygon with `resolution` sides. For a smoother circle drawn with splines, see `Circle`.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool

continues on next page

Table 161 – continued from previous page

Property	Description
<code>antialiased</code> or aa	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or ec	color or None or 'auto'
<code>facecolor</code> or fc	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool

```
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).
```

## Examples using `matplotlib.patches.CirclePolygon`

### `matplotlib.patches.ConnectionPatch`

```
class matplotlib.patches.ConnectionPatch(xyA, xyB, coordsA, coordsB=None,
                                         axesA=None,           axesB=None,
                                         arrowstyle='-', connectionstyle='arc3',
                                         patchA=None,          patchB=None,
                                         shrinkA=0.0,           shrinkB=0.0,
                                         mutation_scale=10.0,    mutation_aspect=None,
                                         clip_on=False,         dpi_cor=<deprecated parameter>,
                                         **kwargs)
```

Bases: `matplotlib.patches.FancyArrowPatch`

A patch that connects two points (possibly in different axes).

Connect point `xyA` in `coordsA` with point `xyB` in `coordsB`.

Valid keys are

Key	Description
<code>arrowstyle</code>	the arrow style
<code>connectionstyle</code>	the connection style
<code>relpos</code>	default is (0.5, 0.5)
<code>patchA</code>	default is bounding box of the text
<code>patchB</code>	default is None
<code>shrinkA</code>	default is 2 points
<code>shrinkB</code>	default is 2 points
<code>mutation_scale</code>	default is text size (in points)
<code>mutation_aspect</code>	default is 1.
?	any key for <code>matplotlib.patches.PathPatch</code>

`coordsA` and `coordsB` are strings that indicate the coordinates of `xyA` and `xyB`.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0, 0 is lower left of figure and 1, 1 is upper right
'subfigure points'	points from the lower left corner of the subfigure
'subfigure pixels'	pixels from the lower left corner of the subfigure
'subfigure fraction'	fraction of the subfigure, 0, 0 is lower left.
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0, 0 is lower left of axes and 1, 1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	offset (in points) from the xy value
'polar'	you can specify <i>theta</i> , <i>r</i> for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

Alternatively they can be set to any valid [Transform](#).

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

**Note:** Using [ConnectionPatch](#) across two [Axes](#) instances is not directly compatible with [constrained\\_layout](#). Add the artist directly to the [Figure](#) instead of adding it to a specific Axes, or exclude it from the layout using `con.set_in_layout(False)`.

```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

```
__init__(self, xyA, xyB, coordsA, coordsB=None, axesA=None, axesB=None, arrowstyle='-'  
        , connectionstyle='arc3', patchA=None, patchB=None, shrinkA=0.0,  
        shrinkB=0.0, mutation_scale=10.0, mutation_aspect=None, clip_on=False,  
        dpi_cor=<deprecated parameter>, **kwargs)
```

Connect point *xyA* in *coordsA* with point *xyB* in *coordsB*.

Valid keys are

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for <a href="#"><i>matplotlib.patches.PathPatch</i></a>

*coordsA* and *coordsB* are strings that indicate the coordinates of *xyA* and *xyB*.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0, 0 is lower left of figure and 1, 1 is upper right
'subfigure points'	points from the lower left corner of the subfigure
'subfigure pixels'	pixels from the lower left corner of the subfigure
'subfigure fraction'	fraction of the subfigure, 0, 0 is lower left.
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0, 0 is lower left of axes and 1, 1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	offset (in points) from the <i>xy</i> value
'polar'	you can specify <i>theta</i> , <i>r</i> for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

Alternatively they can be set to any valid [Transform](#).

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

**Note:** Using [ConnectionPatch](#) across two [Axes](#) instances is not directly compatible with [constrained layout](#). Add the artist directly to the [Figure](#) instead of adding it to a specific Axes, or exclude it from the layout using `con.set_in_layout(False)`.

```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

```
__module__ = 'matplotlib.patches'  
__str__(self)  
    Return str(self).  
  
draw(self, renderer)  
    Draw the Artist (and its children) using the given renderer.  
  
    This has no effect if the artist is not visible (Artist.get_visible returns False).
```

### Parameters

**renderer**  
[`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
get_annotation_clip(self)  
    Return the clipping behavior.  
  
    See set_annotation_clip for the meaning of the return value.
```

```
get_path_in_displaycoord(self)  
    Return the mutated path of the arrow in display coordinates.
```

```
set_annotation_clip(self, b)  
    Set the clipping behavior.
```

### Parameters

**b**  
[bool or None]  

- *False*: The annotation will always be drawn regardless of its position.
- *True*: The annotation will only be drawn if `self.xy` is inside the axes.
- *None*: The annotation will only be drawn if `self.xy` is inside the axes and `self.xycoords == "data"`.

## matplotlib.patches.ConnectionStyle

```
class matplotlib.patches.ConnectionStyle(stylename, **kw)
Bases: matplotlib.patches._Style
```

`ConnectionStyle` is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with `FancyArrowPatch`.

A connectionstyle object can be either created as:

```
ConnectionStyle.Arc3(rad=0.2)
```

or:

```
ConnectionStyle("Arc3", rad=0.2)
```

or:

```
ConnectionStyle("Arc3, rad=0.2")
```

The following classes are defined

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
Angle3	angle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

An instance of any connection style class is an callable object, whose call signature is:

```
__call__(self, posA, posB,
        patchA=None, patchB=None,
        shrinkA=2., shrinkB=2.)
```

and it returns a `Path` instance. `posA` and `posB` are tuples of (x, y) coordinates of the two points to be connected. `patchA` (or `patchB`) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrunk by `shrinkA` (or `shrinkB`) which is given in points.

Return the instance of the subclass with the given style name.

```
class Angle(angleA=90, angleB=0, rad=0.0)
Bases: matplotlib.patches.ConnectionStyle._Base
```

Creates a piecewise continuous quadratic Bezier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which cross the start and end point, and have a slope of `angleA` and `angleB`, respectively. The connecting edges are rounded with `rad`.

`angleA`

starting angle of the path

***angleB***

ending angle of the path

***rad***

rounding radius of the edge

**`__init__(self, angleA=90, angleB=0, rad=0.0)`**

***angleA***

starting angle of the path

***angleB***

ending angle of the path

***rad***

rounding radius of the edge

**`__module__ = 'matplotlib.patches'`**

**`connect(self, posA, posB)`**

**`class Angle3(angleA=90, angleB=0)`**

Bases: `matplotlib.patches.ConnectionStyle._Base`

Creates a simple quadratic Bezier curve between two points. The middle control points is placed at the intersecting point of two lines which cross the start and end point, and have a slope of `angleA` and `angleB`, respectively.

***angleA***

starting angle of the path

***angleB***

ending angle of the path

**`__init__(self, angleA=90, angleB=0)`**

***angleA***

starting angle of the path

***angleB***

ending angle of the path

**`__module__ = 'matplotlib.patches'`**

**`connect(self, posA, posB)`**

**`class Arc(angleA=0, angleB=0, armA=None, armB=None, rad=0.0)`**

Bases: `matplotlib.patches.ConnectionStyle._Base`

Creates a piecewise continuous quadratic Bezier path between two points. The path can have two passing-through points, a point placed at the distance of `armA` and angle of `angleA` from point A, another point with respect to point B. The edges are rounded with `rad`.

***angleA :***

starting angle of the path

---

***angleB*** :  
ending angle of the path

***armA*** :  
length of the starting arm

***armB*** :  
length of the ending arm

***rad*** :  
rounding radius of the edges

**`__init__(self, angleA=0, angleB=0, armA=None, armB=None, rad=0.0)`**

***angleA*** :  
starting angle of the path

***angleB*** :  
ending angle of the path

***armA*** :  
length of the starting arm

***armB*** :  
length of the ending arm

***rad*** :  
rounding radius of the edges

**`__module__ = 'matplotlib.patches'`**

**`connect(self, posA, posB)`**

**`class Arc3(rad=0.0)`**  
Bases: `matplotlib.patches.ConnectionStyle._Base`  
Creates a simple quadratic Bezier curve between two points. The curve is created so that the middle control point (C1) is located at the same distance from the start (C0) and end points(C2) and the distance of the C1 to the line connecting C0-C2 is *rad* times the distance of C0-C2.

***rad***  
curvature of the curve.

**`__init__(self, rad=0.0)`**  
***rad***  
curvature of the curve.

**`__module__ = 'matplotlib.patches'`**

**`connect(self, posA, posB)`**

**`class Bar(armA=0.0, armB=0.0, fraction=0.3, angle=None)`**  
Bases: `matplotlib.patches.ConnectionStyle._Base`

A line with *angle* between A and B with *armA* and *armB*. One of the arms is extended so that they are connected in a right angle. The length of armA is determined by (*armA* + *fraction* x AB distance). Same for armB.

### Parameters

#### armA

[float] minimum length of armA

#### armB

[float] minimum length of armB

#### fraction

[float] a fraction of the distance between two points that will be added to armA and armB.

#### angle

[float or None] angle of the connecting line (if None, parallel to A and B)

### `__init__(self, armA=0.0, armB=0.0, fraction=0.3, angle=None)`

#### Parameters

#### armA

[float] minimum length of armA

#### armB

[float] minimum length of armB

#### fraction

[float] a fraction of the distance between two points that will be added to armA and armB.

#### angle

[float or None] angle of the connecting line (if None, parallel to A and B)

### `__module__ = 'matplotlib.patches'`

### `connect(self, posA, posB)`

### `__module__ = 'matplotlib.patches'`

## Examples using `matplotlib.patches.ConnectionStyle`

### `matplotlib.patches.Ellipse`

**class** `matplotlib.patches.Ellipse(xy, width, height, angle=0, **kwargs)`

Bases: `matplotlib.patches.Patch`

A scale-free ellipse.

### Parameters

**xy**

[float, float] xy coordinates of ellipse centre.

**width**

[float] Total length (diameter) of horizontal axis.

**height**

[float] Total length (diameter) of vertical axis.

**angle**

[float, default: 0] Rotation in degrees anti-clockwise.

**Notes**

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>

Table 162 – continued from previous page

Property	Description
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, xy, width, height, angle=0, **kwargs)`

#### Parameters

##### `xy`

[float, float] xy coordinates of ellipse centre.

##### `width`

[float] Total length (diameter) of horizontal axis.

##### `height`

[float] Total length (diameter) of vertical axis.

##### `angle`

[float, default: 0] Rotation in degrees anti-clockwise.

#### Notes

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '—', '+', 'x', 'o', 'O', '.', '*'}

Table 163 – continued from previous page

Property	Description
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

```

__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

property angle
    Return the angle of the ellipse.

property center
    Return the center of the ellipse.

get_angle(self)
    Return the angle of the ellipse.

get_center(self)
    Return the center of the ellipse.

get_height(self)
    Return the height of the ellipse.

get_patch_transform(self)
    Return the Transform instance mapping patch coordinates to data coordinates.

    For example, one may define a patch of a circle which represents a radius of 5 by providing
    coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate)
    by 5.

get_path(self)
    Return the path of the ellipse.

get_width(self)
    Return the width of the ellipse.

```

**property height**

Return the height of the ellipse.

**set\_angle (self, angle)**

Set the angle of the ellipse.

**Parameters**

**angle**

[float]

**set\_center (self, xy)**

Set the center of the ellipse.

**Parameters**

**xy**

[(float, float)]

**set\_height (self, height)**

Set the height of the ellipse.

**Parameters**

**height**

[float]

**set\_width (self, width)**

Set the width of the ellipse.

**Parameters**

**width**

[float]

**property width**

Return the width of the ellipse.

## matplotlib.patches.FancyArrow

```
class matplotlib.patches.FancyArrow(x, y, dx, dy, width=0.001,
                                      length_includes_head=False,
                                      head_width=None, head_length=None,
                                      shape='full', overhang=0,
                                      head_starts_at_zero=False, **kwargs)
```

Bases: `matplotlib.patches.Polygon`

Like Arrow, but lets you set head width and head height independently.

### Parameters

**width**

[float, default: 0.001] Width of full arrow tail.

**length\_includes\_head**

[bool, default: False] True if head is to be counted in calculating the length.

**head\_width**

[float or None, default: 3\*width] Total width of the full arrow head.

**head\_length**

[float or None, default: 1.5\*head\_width] Length of arrow head.

**shape**

[{'full', 'left', 'right'}, default: 'full'] Draw the left-half, right-half, or full arrow.

**overhang**

[float, default: 0] Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head\_starts\_at\_zero**

[bool, default: False] If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**\*\*kwargs**

*Patch* properties:

`__init__(self, x, y, dx, dy, width=0.001, length_includes_head=False, head_width=None, head_length=None, shape='full', overhang=0, head_starts_at_zero=False, **kwargs)`

### Parameters

#### `width`

[float, default: 0.001] Width of full arrow tail.

#### `length_includes_head`

[bool, default: False] True if head is to be counted in calculating the length.

#### `head_width`

[float or None, default: 3\*width] Total width of the full arrow head.

#### `head_length`

[float or None, default: 1.5\*head\_width] Length of arrow head.

#### `shape`

[{'full', 'left', 'right'}, default: 'full'] Draw the left-half, right-half, or full arrow.

#### `overhang`

[float, default: 0] Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

#### `head_starts_at_zero`

[bool, default: False] If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

#### `**kwargs`

`Patch` properties:

Property	Description

    Return str(self).
```

## Examples using `matplotlib.patches.FancyArrow`

### `matplotlib.patches.FancyArrowPatch`

```
class matplotlib.patches.FancyArrowPatch(posA=None, posB=None, path=None,
                                         arrowstyle='simple',           connectionstyle='arc3',      patchA=None,
                                         patchB=None, shrinkA=2, shrinkB=2,
                                         mutation_scale=1, mutation_aspect=1,
                                         dpi_cor=<deprecated parameter>,
                                         **kwargs)
```

Bases: `matplotlib.patches.Patch`

A fancy arrow patch. It draws an arrow using the `ArrowStyle`.

The head and tail positions are fixed at the specified start and end points of the arrow, but the size and shape (in display coordinates) of the arrow does not change when the axis is moved or zoomed.

There are two ways for defining an arrow:

- If `posA` and `posB` are given, a path connecting two points is created according to `connectionstyle`. The path will be clipped with `patchA` and `patchB` and further shrunken by `shrinkA` and `shrinkB`. An arrow is drawn along this resulting path using the `arrowstyle` parameter.
- Alternatively if `path` is provided, an arrow is drawn along this path and `patchA`, `patchB`, `shrinkA`, and `shrinkB` are ignored.

#### Parameters

##### `posA, posB`

[float, float], default: None] (x, y) coordinates of arrow tail and arrow head respectively.

##### `path`

[`Path`, default: None] If provided, an arrow is drawn along this path and `patchA`, `patchB`, `shrinkA`, and `shrinkB` are ignored.

##### `arrowstyle`

[str or `ArrowStyle`, default: 'simple']

The `ArrowStyle` with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional attributes are meant to be scaled with the `mutation_scale`. The following arrow styles are available:

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	- [	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	-   >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	<   -	head_length=0.4, head_width=0.2
Curve-FilledAB	<   -   >	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
Brack- etAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	sim- ple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

### connectionstyle

[str or *ConnectionStyle* or None, optional, default: 'arc3']

The *ConnectionStyle* with which *posA* and *posB* are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
An- gle3	an- gle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

### patchA, patchB

[*Patch*, default: None] Head and tail patches, respectively.

### shrinkA, shrinkB

[float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

### mutation\_scale

[float, default: 1] Value with which attributes of *arrowstyle* (e.g., *head\_length*) will be scaled.

### **mutation\_aspect**

[None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

### **dpi\_cor**

[float, default: 1] dpi\_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this. Deprecated.

## Other Parameters

### **\*\*kwargs**

[*Patch* properties, optional] Here is a list of available *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or ls	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<i>linewidth</i> or lw	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>

continues on next page

Table 166 – continued from previous page

Property	Description
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

In contrast to other patches, the default `capstyle` and `joinstyle` for `FancyArrowPatch` are set to "round".

`__init__(self, posA=None, posB=None, path=None, arrowstyle='simple', connectionstyle='arc3', patchA=None, patchB=None, shrinkA=2, shrinkB=2, mutation_scale=1, mutation_aspect=1, dpi_cor=<deprecated parameter>, **kwargs)`

There are two ways for defining an arrow:

- If `posA` and `posB` are given, a path connecting two points is created according to `connectionstyle`. The path will be clipped with `patchA` and `patchB` and further shrunken by `shrinkA` and `shrinkB`. An arrow is drawn along this resulting path using the `arrowstyle` parameter.
- Alternatively if `path` is provided, an arrow is drawn along this path and `patchA`, `patchB`, `shrinkA`, and `shrinkB` are ignored.

## Parameters

### `posA, posB`

[(float, float), default: None] (x, y) coordinates of arrow tail and arrow head respectively.

### `path`

[`Path`, default: None] If provided, an arrow is drawn along this path and `patchA`, `patchB`, `shrinkA`, and `shrinkB` are ignored.

### `arrowstyle`

[str or `ArrowStyle`, default: 'simple']

The `ArrowStyle` with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional attributes are meant to be scaled with the `mutation_scale`. The following arrow styles are available:

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	- [	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	-   >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	<   -	head_length=0.4, head_width=0.2
Curve-FilledAB	<   -   >	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
Brack- etAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	sim- ple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

**connectionstyle**

[str or *ConnectionStyle* or None, optional, default: 'arc3']

The *ConnectionStyle* with which *posA* and *posB* are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
Ang- le3	an- gle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

**patchA, patchB**

[*Patch*, default: None] Head and tail patches, respectively.

**shrinkA, shrinkB**

[float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

**mutation\_scale**

[float, default: 1] Value with which attributes of *arrowstyle* (e.g., *head\_length*) will be scaled.

#### mutation\_aspect

[None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

#### dpi\_cor

[float, default: 1] dpi\_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this. Deprecated.

### Other Parameters

#### \*\*kwargs

[*Patch* properties, optional] Here is a list of available *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\'', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or ls	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<i>linewidth</i> or lw	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>

continues on next page

Table 167 – continued from previous page

Property	Description
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

In contrast to other patches, the default `capstyle` and `joinstyle` for `FancyArrowPatch` are set to "round".

```
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).
```

### Parameters

**renderer**  
`[RendererBase subclass.]`

### Notes

This method is overridden in the Artist subclasses.

```
get_arrowstyle(self)
    Return the arrowstyle object.

get_connectionstyle(self)
    Return the ConnectionStyle used.

get_dpi_cor(self)
    [Deprecated] dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.
```

### Returns

**scalar**

## Notes

Deprecated since version 3.4.

**get\_mutation\_aspect(self)**

Return the aspect ratio of the bbox mutation.

**get\_mutation\_scale(self)**

Return the mutation scale.

## Returns

**scalar**

**get\_path(self)**

Return the path of the arrow in the data coordinates. Use get\_path\_in\_displaycoord() method to retrieve the arrow path in display coordinates.

**get\_path\_in\_displaycoord(self)**

Return the mutated path of the arrow in display coordinates.

**set\_arrowstyle(self, arrowstyle=None, \*\*kw)**

Set the arrow style. Old attributes are forgotten. Without arguments (or with arrowstyle=None) returns available box styles as a list of strings.

## Parameters

**arrowstyle**

[None or ArrowStyle or str, default: None] Can be a string with arrowstyle name with optional comma-separated attributes, e.g.:

```
set_arrowstyle("Fancy,head_length=0.2")
```

Alternatively attributes can be provided as keywords, e.g.:

```
set_arrowstyle("fancy", head_length=0.2)
```

**set\_connectionstyle(self, connectionstyle, \*\*kw)**

Set the connection style. Old attributes are forgotten.

## Parameters

**connectionstyle**

[str or ConnectionStyle or None, optional] Can be a string with connectionstyle name with optional comma-separated attributes, e.g.:

```
set_connectionstyle("arc,angleA=0,armA=30,rad=10")
```

Alternatively, the attributes can be provided as keywords, e.g.:

```
set_connectionstyle("arc", angleA=0, armA=30, rad=10)
```

Without any arguments (or with `connectionstyle=None`), return available styles as a list of strings.

### `set_dpi_cor(self, dpi_cor)`

[*Deprecated*] `dpi_cor` is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

#### Parameters

##### `dpi_cor`

[float]

#### Notes

Deprecated since version 3.4.

### `set_mutation_aspect(self, aspect)`

Set the aspect ratio of the bbox mutation.

#### Parameters

##### `aspect`

[float]

### `set_mutation_scale(self, scale)`

Set the mutation scale.

#### Parameters

##### `scale`

[float]

### `set_patchA(self, patchA)`

Set the tail patch.

#### Parameters

##### `patchA`

[*patches.Patch*]

### `set_patchB(self, patchB)`

Set the head patch.

#### Parameters

**patchB**

[*patches.Patch*]

**set\_positions (self, posA, posB)**

Set the begin and end positions of the connecting path.

**Parameters****posA, posB**

[None, tuple] (x, y) coordinates of arrow tail and arrow head respectively. If `None` use current value.

**Examples using `matplotlib.patches.FancyArrowPatch`**

- sphx\_glr\_gallery\_pie\_and\_polar\_charts\_bar\_of\_pie.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_arrow\_guide.py
- sphx\_glr\_gallery\_userdemo\_connect\_simple01.py

**matplotlib.patches.FancyBboxPatch**

```
class matplotlib.patches.FancyBboxPatch(xy, width, height, boxstyle='round',
                                         bbox_transmuter=<deprecated parameter>, mutation_scale=1, mutation_aspect=1, **kwargs)
```

Bases: *matplotlib.patches.Patch*

A fancy box around a rectangle with lower left at  $xy = (x, y)$  with specified width and height.

*FancyBboxPatch* is similar to *Rectangle*, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the style classes defined in *BoxStyle*.

**Parameters****xy**

[float, float] The lower left corner of the box.

**width**

[float] The width of the box.

**height**

[float] The height of the box.

**boxstyle**

[str or *matplotlib.patches.BoxStyle*]

The style of the fancy box. This can either be a `BoxStyle` instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to `BoxStyle` to construct a `BoxStyle` object. See there for a full documentation.

The following box styles are available:

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

#### `mutation_scale`

[float, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding\_size).

#### `mutation_aspect`

[float, default: 1] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

### Other Parameters

#### `**kwargs`

[`Patch` properties]

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array

<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, xy, width, height, boxstyle='round', bbox_transmuter=<deprecated parameter>, mutation_scale=1, mutation_aspect=1, **kwargs)`

### Parameters

#### `xy`

[float, float] The lower left corner of the box.

#### `width`

[float] The width of the box.

#### `height`

[float] The height of the box.

#### `boxstyle`

[str or `matplotlib.patches.BoxStyle`]

The style of the fancy box. This can either be a `BoxStyle` instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to `BoxStyle` to construct a `BoxStyle` object. See there for a full documentation.

The following box styles are available:

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

**mutation\_scale**

[float, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding\_size).

**mutation\_aspect**

[float, default: 1] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

```

__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

get_bbox(self)
    Return the Bbox.

get_boxstyle(self)
    Return the boxstyle object.

get_height(self)
    Return the height of the rectangle.

get_mutation_aspect(self)
    Return the aspect ratio of the bbox mutation.

get_mutation_scale(self)
    Return the mutation scale.

get_path(self)
    Return the mutated path of the rectangle.

get_width(self)
    Return the width of the rectangle.

get_x(self)
    Return the left coord of the rectangle.

get_y(self)
    Return the bottom coord of the rectangle.

set_bounds(self, *args)
    Set the bounds of the rectangle.

Call signatures:
```

```
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

## Parameters

### **left, bottom**

[float] The coordinates of the bottom left corner of the rectangle.

### **width, height**

[float] The width/height of the rectangle.

### **set\_boxstyle(self, boxstyle=None, \*\*kwargs)**

Set the box style.

Most box styles can be further configured using attributes. Attributes from the previous box style are not reused.

Without argument (or with `boxstyle=None`), the available box styles are returned as a human-readable string.

## Parameters

### **boxstyle**

[str or `matplotlib.patches.BoxStyle`]

The style of the fancy box. This can either be a `BoxStyle` instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to `BoxStyle` to construct a `BoxStyle` object. See there for a full documentation.

The following box styles are available:

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

### **\*\*kwargs**

Additional attributes for the box style. See the table above for supported parameters.

## Examples

```
set_boxstyle("round, pad=0.2")
set_boxstyle("round", pad=0.2)
```

**set\_height** (*self, h*)

Set the rectangle height.

### Parameters

**h**

[float]

**set\_mutation\_aspect** (*self, aspect*)

Set the aspect ratio of the bbox mutation.

### Parameters

**aspect**

[float]

**set\_mutation\_scale** (*self, scale*)

Set the mutation scale.

### Parameters

**scale**

[float]

**set\_width** (*self, w*)

Set the rectangle width.

### Parameters

**w**

[float]

**set\_x** (*self, x*)

Set the left coord of the rectangle.

### Parameters

**x**

[float]

**set\_y**(*self*, *y*)

Set the bottom coord of the rectangle.

**Parameters****y**

[float]

**Examples using `matplotlib.patches.FancyBboxPatch`**

- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_fancybox\_demo.py
- sphx\_glr\_gallery\_userdemo\_annotate\_text\_arrow.py

**`matplotlib.patches.Patch`**

```
class matplotlib.patches.Patch(edgecolor=None, facecolor=None, color=None,  

linewidth=None, linestyle=None, antialiased=None,  

hatch=None, fill=True, capstyle=None, joinstyle=None, **kwargs)
```

Bases: *matplotlib.artist.Artist*

A patch is a 2D artist with a face color and an edge color.

If any of *edgecolor*, *facecolor*, *linewidth*, or *antialiased* are *None*, they default to their rc params setting.

The following kwarg properties are supported

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str

Table 171 – continued from previous page

Property	Description
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**\_\_module\_\_** = 'matplotlib.patches'  
**contains** (*self*, *mouseevent*, *radius=None*)  
Test whether the mouse event occurred in the patch.

**Returns**

(bool, empty dict)

**contains\_point** (*self*, *point*, *radius=None*)  
Return whether the given point is inside the patch.

**Parameters****point**

[(float, float)] The point (x, y) to check, in target coordinates of *self.get\_transform()*. These are display coordinates for patches that are added to a figure or axes.

**radius**

[float, optional] Add an additional margin on the patch in target coordinates of *self.get\_transform()*. See `Path.contains_point` for further details.

**Returns****bool**

## Notes

The proper use of this method depends on the transform of the patch. Isolated patches do not have a transform. In this case, the patch creation coordinates and the point coordinates match. The following example checks that the center of a circle is within the circle

```
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> c.contains_point(center)
True
```

The convention of checking against the transformed patch stems from the fact that this method is predominantly used to check if display coordinates (e.g. from mouse events) are within the patch. If you want to do the above check with data coordinates, you have to properly transform them first:

```
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> plt.gca().add_patch(c)
>>> transformed_center = c.get_transform().transform(center)
>>> c.contains_point(transformed_center)
True
```

### `contains_points(self, points, radius=None)`

Return whether the given points are inside the patch.

#### Parameters

##### `points`

[(N, 2) array] The points to check, in target coordinates of `self.get_transform()`. These are display coordinates for patches that are added to a figure or axes. Columns contain x and y values.

##### `radius`

[float, optional] Add an additional margin on the patch in target coordinates of `self.get_transform()`. See [`Path.contains\_point`](#) for further details.

#### Returns

##### `length-N bool array`

## Notes

The proper use of this method depends on the transform of the patch. See the notes on [Patch.contains\\_point](#).

### `draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible ([Artist.get\\_visible](#) returns False).

### Parameters

#### `renderer`

[[RendererBase](#) subclass.]

## Notes

This method is overridden in the Artist subclasses.

### `property fill`

Return whether the patch is filled.

### `get_aa(self)`

Alias for [get\\_antialiased](#).

### `get_antialiased(self)`

Return whether antialiasing is used for drawing.

### `get_capstyle(self)`

Return the capstyle.

### `get_data_transform(self)`

Return the [Transform](#) mapping data coordinates to physical coordinates.

### `get_ec(self)`

Alias for [get\\_edgecolor](#).

### `get_edgecolor(self)`

Return the edge color.

### `get_extents(self)`

Return the [Patch](#)'s axis-aligned extents as a [Bbox](#).

### `get_facecolor(self)`

Return the face color.

### `get_fc(self)`

Alias for [get\\_facecolor](#).

### `get_fill(self)`

Return whether the patch is filled.

### `get_hatch(self)`

Return the hatching pattern.

**get\_joinstyle(self)**

Return the joinstyle.

**get\_linestyle(self)**

Return the linestyle.

**get\_linewidth(self)**

Return the line width in points.

**get\_ls(self)**

Alias for [get\\_linestyle](#).

**get\_lw(self)**

Alias for [get\\_linewidth](#).

**get\_patch\_transform(self)**

Return the [Transform](#) instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

**get\_path(self)**

Return the path of this patch.

**get\_transform(self)**

Return the [Transform](#) applied to the *Patch*.

**get\_verts(self)**

Return a copy of the vertices used in this patch.

If the patch contains Bezier curves, the curves will be interpolated by line segments. To access the curves as curves, use [get\\_path](#).

**get\_window\_extent(self, renderer=None)**

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**set\_aa(self, aa)**

Alias for [set\\_antialiased](#).

**set\_alpha(self, alpha)**

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha**

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

**set\_antialiased(self, aa)**

Set whether to use antialiased rendering.

**Parameters****b**

[bool or None]

**set\_capstyle(self, s)**

Set the *CapStyle*.

**Parameters****s**

[*CapStyle* or {'butt', 'projecting', 'round'}]

**set\_color(self, c)**

Set both the edgecolor and the facecolor.

**Parameters****c**

[color]

**See also:**

`Patch.set_facecolor`, `Patch.set_edgecolor`

For setting the edge or face color individually.

**set\_ec(self, color)**

Alias for `set_edgecolor`.

**set\_edgecolor(self, color)**

Set the patch edge color.

**Parameters****color**

[color or None or 'auto']

**set\_facecolor(self, color)**

Set the patch face color.

**Parameters**

**color**

[color or None]

**set\_fc**(*self*, *color*)Alias for [set\\_facecolor](#).**set\_fill**(*self*, *b*)

Set whether to fill the patch.

**Parameters****b**

[bool]

**set\_hatch**(*self*, *hatch*)

Set the hatching pattern.

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Latters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

**Parameters****hatch**

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

**set\_joinstyle**(*self*, *s*)Set the [JoinStyle](#).**Parameters****s**[[JoinStyle](#) or {'miter', 'round', 'bevel'}]

**set\_linenstyle**(*self, ls*)

Set the patch linestyle.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-. ' or 'dashdot'	dash-dotted line
' : ' or 'dotted'	dotted line
'None'	draw nothing
'none'	draw nothing
' '	draw nothing
' '	draw nothing

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq)
--------------------

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters****ls**

[{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}] The line style.

**set\_linewidth**(*self, w*)

Set the patch linewidth in points.

**Parameters****w**

[float or None]

**set\_ls**(*self, ls*)

Alias for `set_linenstyle`.

**set\_lw**(*self, w*)

Alias for `set_linewidth`.

**update\_from**(*self, other*)

Copy properties from *other* to *self*.

`validCap = ('butt', 'projecting', 'round')`

`validJoin = ('miter', 'round', 'bevel')`

`zorder = 1`

### matplotlib.patches.PathPatch

**class** matplotlib.patches.PathPatch(*path*, *\*\*kwargs*)  
Bases: *matplotlib.patches.Patch*

A general polycurve path patch.

*path* is a *Path* object.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>label</i>	object

## matplotlib.patches.StepPatch

```
class matplotlib.patches.StepPatch(values, edges, *, orientation='vertical', baseline=0, **kwargs)
```

Bases: *matplotlib.patches.PathPatch*

A path patch describing a stepwise constant function.

By default the path is not closed and starts and stops at baseline value.

### Parameters

#### values

[array-like] The step heights.

#### edges

[array-like] The edge positions, with `len(edges) == len(vals) + 1`, between which the curve takes on `vals` values.

#### orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The direction of the steps. Vertical means that `values` are along the y-axis, and edges are along the x-axis.

#### baseline

[float, array-like or None, default: 0] The bottom value of the bounding edges or when `fill=True`, position of lower edge. If `fill` is True or an array is passed to `baseline`, a closed path is drawn.

**Other valid keyword arguments are:**

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or aa	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or ec	color or None or 'auto'
<code>facecolor</code> or fc	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool

continues on next page

Table 174 – continued from previous page

Property	Description
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, values, edges, *, orientation='vertical', baseline=0, **kwargs)`

### Parameters

#### values

[array-like] The step heights.

#### edges

[array-like] The edge positions, with `len(edges) == len(vals) + 1`, between which the curve takes on `vals` values.

#### orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The direction of the steps. Vertical means that `values` are along the y-axis, and edges are along the x-axis.

#### baseline

[float, array-like or None, default: 0] The bottom value of the bounding edges or when `fill=True`, position of lower edge. If `fill` is True or an array is passed to `baseline`, a closed path is drawn.

#### Other valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown

continues on next page

Table 175 – continued from previous page

Property	Description
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}

<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

```

__module__ = 'matplotlib.patches'

get_data(self)
    Get StepPatch values, edges and baseline as namedtuple.

set_data(self, values=None, edges=None, baseline=None)
    Set StepPatch values, edges and baseline.

```

### Parameters

#### values

[1D array-like or None] Will not update values, if passing None

#### edges

[1D array-like, optional]

#### baseline

[float, 1D array-like or None]

## Examples using `matplotlib.patches.StepPatch`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_stairs\_demo.py

## `matplotlib.patches.Polygon`

**class** `matplotlib.patches.Polygon`(*xy*, *closed=True*, *\*\*kwargs*)  
Bases: `matplotlib.patches.Patch`

A general polygon patch.

*xy* is a numpy array with shape Nx2.

If *closed* is *True*, the polygon will be closed so the starting and ending points are the same.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)

<code>transform</code>	<code>Transform</code>
<code>url</code>	str

continues on next page

Table 176 – continued from previous page

Property	Description
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, xy, closed=True, **kwargs)`

`xy` is a numpy array with shape Nx2.

If `closed` is `True`, the polygon will be closed so the starting and ending points are the same.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

```
__module__ = 'matplotlib.patches'  
__str__(self)  
    Return str(self).  
get_closed(self)  
    Return whether the polygon is closed.  
get_path(self)  
    Get the Path of the polygon.  
get_xy(self)  
    Get the vertices of the path.
```

**Returns**

**(N, 2) numpy array**

The coordinates of the vertices.

```
set_closed(self, closed)  
    Set whether the polygon is closed.
```

**Parameters**

**closed**

[bool] True if the polygon is closed

```
set_xy(self, xy)  
    Set the vertices of the polygon.
```

**Parameters**

**xy**

[(N, 2) array-like] The coordinates of the vertices.

**Notes**

Unlike *Path*, we do not ignore the last input vertex. If the polygon is meant to be closed, and the last point of the polygon is not equal to the first, we assume that the user has not explicitly passed a CLOSEPOLY vertex, and add it ourselves.

```
property xy  
    The vertices of the path as (N, 2) numpy array.
```

## Examples using `matplotlib.patches.Polygon`

- *Annotations*

## `matplotlib.patches.Rectangle`

**class** `matplotlib.patches.Rectangle` (*xy*, *width*, *height*, *angle*=0.0, *\*\*kwargs*)  
 Bases: `matplotlib.patches.Patch`

A rectangle defined via an anchor point *xy* and its *width* and *height*.

The rectangle extends from *xy*[0] to *xy*[0] + *width* in x-direction and from *xy*[1] to *xy*[1] + *height* in y-direction.

```
:           +-----+
:           |
:           height
:           |
:           (xy) --- width ---+
```

One may picture *xy* as the bottom left corner, but which corner *xy* is actually depends on the direction of the axis and the sign of *width* and *height*; e.g. *xy* would be the bottom right corner if the x-axis was inverted or if *width* was negative.

### Parameters

#### `xy`

[(float, float)] The anchor point.

#### `width`

[float] Rectangle width.

#### `height`

[float] Rectangle height.

**angle**

[float, default: 0] Rotation in degrees anti-clockwise about *xy*.

**Other Parameters****\*\*kwargs**

[*Patch* properties]

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array

**\_\_init\_\_** (*self*, *xy*, *width*, *height*, *angle*=0.0, \*\**kwargs*)

**Parameters**

**xy**

[(float, float)] The anchor point.

### width

[float] Rectangle width.

### height

[float] Rectangle height.

### angle

[float, default: 0] Rotation in degrees anti-clockwise about xy.

## Other Parameters

### \*\*kwargs

[*Patch* properties]

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or aa	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or ec	color or None or 'auto'
<code>facecolor</code> or fc	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool

<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str

continues on next page

Table 179 – continued from previous page

Property	Description
<code>visible</code>	bool
<code>zorder</code>	float

```
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

get_bbox(self)
    Return the Bbox.

get_height(self)
    Return the height of the rectangle.

get_patch_transform(self)
    Return the Transform instance mapping patch coordinates to data coordinates.

    For example, one may define a patch of a circle which represents a radius of 5 by providing
    coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate)
    by 5.

get_path(self)
    Return the vertices of the rectangle.

get_width(self)
    Return the width of the rectangle.

get_x(self)
    Return the left coordinate of the rectangle.

get_xy(self)
    Return the left and bottom coords of the rectangle as a tuple.

get_y(self)
    Return the bottom coordinate of the rectangle.

set_bounds(self, *args)
    Set the bounds of the rectangle as left, bottom, width, height.

    The values may be passed as separate parameters or as a tuple:

    set_bounds(left, bottom, width, height)
    set_bounds((left, bottom, width, height))

set_height(self, h)
    Set the height of the rectangle.

set_width(self, w)
    Set the width of the rectangle.

set_x(self, x)
    Set the left coordinate of the rectangle.
```

**set\_xy**(*self*, *xy*)

Set the left and bottom coordinates of the rectangle.

**Parameters****xy**

[(float, float)]

**set\_y**(*self*, *y*)

Set the bottom coordinate of the rectangle.

**property xy**

Return the left and bottom coords of the rectangle as a tuple.

## **matplotlib.patches.RegularPolygon**

```
class matplotlib.patches.RegularPolygon(xy, numVertices, radius=5, orientation=0, **kwargs)
```

Bases: *matplotlib.patches.Patch*

A regular polygon patch.

### **Parameters**

#### **xy**

[float, float] The center position.

#### **numVertices**

[int] The number of vertices.

#### **radius**

[float] The distance from the center to each of the vertices.

#### **orientation**

[float] The polygon rotation angle (in radians).

#### **\*\*kwargs**

*Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None

<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, xy, numVertices, radius=5, orientation=0, **kwargs)`

### Parameters

#### `xy`

[(float, float)] The center position.

#### `numVertices`

[int] The number of vertices.

#### `radius`

[float] The distance from the center to each of the vertices.

#### `orientation`

[float] The polygon rotation angle (in radians).

#### `**kwargs`

`Patch` properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}

- sphx\_glr\_gallery\_specialty\_plots\_radar\_chart.py

**matplotlib.patches.Shadow**

```
class matplotlib.patches.Shadow(patch, ox, oy, props=<deprecated parameter>,  
                                 **kwargs)
```

Bases: *matplotlib.patches.Patch*

Create a shadow of the given *patch*.

By default, the shadow will have the same face color as the *patch*, but darkened.

**Parameters****patch**

[*Patch*] The patch to create the shadow for.

**ox, oy**

[float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

**props**

[dict] *deprecated* (*use kwargs instead*) Properties of the shadow patch.

**\*\*kwargs**

Properties of the shadow patch. Supported keys are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None

<i>linewidth</i> or lw	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>

continues on next page

Table 182 – continued from previous page

Property	Description
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`__init__(self, patch, ox, oy, props=<deprecated parameter>, **kwargs)`

Create a shadow of the given `patch`.

By default, the shadow will have the same face color as the `patch`, but darkened.

### Parameters

#### `patch`

[`Patch`] The patch to create the shadow for.

#### `ox, oy`

[float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

#### `props`

[dict] *deprecated (use kwargs instead)* Properties of the shadow patch.

#### `**kwargs`

Properties of the shadow patch. Supported keys are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown

<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

```
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

    This has no effect if the artist is not visible (Artist.get_visible returns False).
```

### Parameters

`renderer`  
 [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`get_patch_transform(self)`  
 Return the `Transform` instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path(self)`  
 Return the path of this patch.

`property props`

## Examples using `matplotlib.patches.Shadow`

- sphx\_glr\_gallery\_misc\_svg\_filter\_pie.py

## matplotlib.patches.Wedge

**class** `matplotlib.patches.Wedge` (*center*, *r*, *theta1*, *theta2*, *width=None*, *\*\*kwargs*)  
Bases: `matplotlib.patches.Patch`

Wedge shaped patch.

A wedge centered at *x*, *y* center with radius *r* that sweeps *theta1* to *theta2* (in degrees). If *width* is given, then a partial wedge is drawn from inner radius *r* - *width* to outer radius *r*.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None

<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "(offset, on-off-seq), ..."}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>

continues on next page

Table 184 – continued from previous page

Property	Description
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**`__init__(self, center, r, theta1, theta2, width=None, **kwargs)`**

A wedge centered at  $x, y$  center with radius  $r$  that sweeps  $\theta_1$  to  $\theta_2$  (in degrees). If  $width$  is given, then a partial wedge is drawn from inner radius  $r - width$  to outer radius  $r$ .

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'

## 18.36.2 Functions

<code>bbox_artist</code> (artist, renderer[, props, fill])	A debug function to draw a rectangle around the bounding box returned by an artist's <code>Artist.get_window_extent</code> to test whether the artist is returning the correct bbox.
<code>draw_bbox</code> (bbox, renderer[, color, trans])	A debug function to draw a rectangle around the bounding box returned by an artist's <code>Artist.get_window_extent</code> to test whether the artist is returning the correct bbox.

### `matplotlib.patches.bbox_artist`

`matplotlib.patches.bbox_artist`(*artist, renderer, props=None, fill=True*)

A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.

*props* is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.

## Examples using `matplotlib.patches.bbox_artist`

### `matplotlib.patches.draw_bbox`

`matplotlib.patches.draw_bbox(bbox, renderer, color='k', trans=None)`

A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.

## Examples using `matplotlib.patches.draw_bbox`

## 18.37 `matplotlib.path`

A module for dealing with the polylines used throughout Matplotlib.

The primary class for polyline handling in Matplotlib is `Path`. Almost all vector drawing makes use of `Paths` somewhere in the drawing pipeline.

Whilst a `Path` instance itself cannot be drawn, some `Artist` subclasses, such as `PathPatch` and `PathCollection`, can be used for convenient `Path` visualisation.

```
class matplotlib.path.Path(vertices, codes=None, _interpolation_steps=1,
                           closed=False, readonly=False)
```

Bases: `object`

A series of possibly disconnected, possibly closed, line and curve segments.

The underlying storage is made up of two parallel numpy arrays:

- `vertices`: an Nx2 float array of vertices
- `codes`: an N-length uint8 array of vertex types, or None

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices as well as three codes `CURVE3`.

The code types are:

- **STOP**

[1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)

- **MOVETO**

[1 vertex] Pick up the pen and move to the given vertex.

- **LINETO**

[1 vertex] Draw a line from the current position to the given vertex.

- **CURVE3**

[1 control point, 1 endpoint] Draw a quadratic Bezier curve from the current position, with the given control point, to the given end point.

- **CURVE4**

[2 control points, 1 endpoint] Draw a cubic Bezier curve from the current position, with the given control points, to the given end point.

- **CLOSEPOLY**

[1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

If *codes* is None, it is interpreted as a MOVETO followed by a series of LINETO.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use *iter\_segments* or *cleaned* to get the vertex/code pairs. This helps, in particular, to consistently handle the case of *codes* being None.

Some behavior of Path objects can be controlled by rcParams. See the rcParams whose keys start with 'path.'

---

**Note:** The vertices and codes arrays should be treated as immutable -- there are a number of optimizations and assumptions made up front in the constructor that will not change when the data changes.

---

Create a new path with the given vertices and codes.

### Parameters

#### **vertices**

[(N, 2) array-like] The path vertices, as an array, masked array or sequence of pairs. Masked values, if any, will be converted to NaNs, which are then handled correctly by the Agg PathIterator and other consumers of path data, such as *iter\_segments()*.

#### **codes**

[array-like or None, optional] n-length array integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, *vertices* will be treated as a series of line segments.

#### **\_interpolation\_steps**

[int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

#### **closed**

[bool, optional] If *codes* is None and closed is True, vertices will be treated as line segments of a closed polygon. Note that the last vertex will then be ignored (as the corresponding code will be set to CLOSEPOLY).

#### **readonly**

[bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

---

```

CLOSEPOLY = 79
CURVE3 = 3
CURVE4 = 4
LINETO = 2
MOVETO = 1
NUM_VERTICES_FOR_CODE = {0: 1, 1: 1, 2: 1, 3: 2, 4: 3, 79: 1}

```

A dictionary mapping Path codes to the number of vertices that the code expects.

```
STOP = 0
```

```
classmethod arc(theta1, theta2, n=None, is_wedge=False)
```

Return the unit circle arc from angles *theta1* to *theta2* (in degrees).

*theta2* is unwrapped to produce the shortest arc within 360 degrees. That is, if *theta2* > *theta1* + 360, the arc will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

Masionobe, L. 2003. Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.

```
classmethod circle(center=0.0, 0.0, radius=1.0, readonly=False)
```

Return a [Path](#) representing a circle of a given radius and center.

## Parameters

### center

[(float, float), default: (0, 0)] The center of the circle.

### radius

[float, default: 1] The radius of the circle.

### readonly

[bool] Whether the created path should have the "readonly" argument set when creating the Path instance.

## Notes

The circle is approximated using 8 cubic Bezier curves, as described in

Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

```
cleanned(self, transform=None, remove_nans=False, clip=None, quantize=<deprecated parameter>, simplify=False, curves=False, stroke_width=1.0, snap=False, sketch=None)
```

Return a new Path with vertices and codes cleaned according to the parameters.

## See also:

**`Path.iter_segments`**

for details of the keyword arguments.

**`clip_to_bbox(self, bbox, inside=True)`**

Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If `inside` is `True`, clip to the inside of the box, otherwise to the outside of the box.

**`code_type`**

alias of `numpy.uint8`

**`property codes`**

The list of codes in the `Path` as a 1D numpy array. Each code is one of `STOP`, `MOVETO`, `LINETO`, `CURVE3`, `CURVE4` or `CLOSEPOLY`. For codes that correspond to more than one vertex (`CURVE3` and `CURVE4`), that code will be repeated so that the length of `self.vertices` and `self.codes` is always the same.

**`contains_path(self, path, transform=None)`**

Return whether this (closed) path completely contains the given path.

If `transform` is not `None`, the path will be transformed before checking for containment.

**`contains_point(self, point, transform=None, radius=0.0)`**

Return whether the area enclosed by the path contains the given point.

The path is always treated as closed; i.e. if the last code is not `CLOSEPOLY` an implicit segment connecting the last vertex to the first vertex is assumed.

**Parameters****`point`**

`[(float, float)]` The point (x, y) to check.

**`transform`**

`[matplotlib.transforms.Transform, optional]` If not `None`, `point` will be compared to `self` transformed by `transform`; i.e. for a correct check, `transform` should transform the path into the coordinate system of `point`.

**`radius`**

`[float, default: 0]` Add an additional margin on the path in coordinates of `point`. The path is extended tangentially by `radius/2`; i.e. if you would draw the path with a linewidth of `radius`, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

**Returns****`bool`**

## Notes

The current algorithm has some limitations:

- The result is undefined for points exactly at the boundary (i.e. at the path shifted by *radius*/2).
- The result is undefined if there is no enclosed area, i.e. all vertices are on a straight line.
- If bounding lines start to cross each other due to *radius* shift, the result is not guaranteed to be correct.

**contains\_points** (*self*, *points*, *transform=None*, *radius=0.0*)

Return whether the area enclosed by the path contains the given points.

The path is always treated as closed; i.e. if the last code is not CLOSEPOLY an implicit segment connecting the last vertex to the first vertex is assumed.

### Parameters

#### points

[(N, 2) array] The points to check. Columns contain x and y values.

#### transform

[*matplotlib.transforms.Transform*, optional] If not None, *points* will be compared to *self* transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *points*.

#### radius

[float, default: 0] Add an additional margin on the path in coordinates of *points*. The path is extended tangentially by *radius*/2; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

### Returns

#### length-N bool array

## Notes

The current algorithm has some limitations:

- The result is undefined for points exactly at the boundary (i.e. at the path shifted by *radius*/2).
- The result is undefined if there is no enclosed area, i.e. all vertices are on a straight line.
- If bounding lines start to cross each other due to *radius* shift, the result is not guaranteed to be correct.

**copy(self)**

Return a shallow copy of the [Path](#), which will share the vertices and codes with the source [Path](#).

**deepcopy(self, memo=None)**

Return a deepcopy of the [Path](#). The [Path](#) will not be readonly, even if the source [Path](#) is.

**get\_extents(self, transform=None, \*\*kwargs)**

Get Bbox of the path.

**Parameters****transform**

[matplotlib.transforms.Transform, optional] Transform to apply to path before computing extents, if any.

**\*\*kwargs**

Forwarded to [iter\\_bezier](#).

**Returns****matplotlib.transforms.Bbox**

The extents of the path Bbox([[xmin, ymin], [xmax, ymax]])

**static hatch(hatchpattern, density=6)**

Given a hatch specifier, *hatchpattern*, generates a Path that can be used in a repeated hatching pattern. *density* is the number of lines per unit square.

**interpolated(self, steps)**

Return a new path resampled to length N x steps.

Codes other than LINETO are not handled correctly.

**intersects\_bbox(self, bbox, filled=True)**

Return whether this path intersects a given [Bbox](#).

If *filled* is True, then this also returns True if the path completely encloses the [Bbox](#) (i.e., the path is treated as filled).

The bounding box is always considered filled.

**intersects\_path(self, other, filled=True)**

Return whether if this path intersects another given path.

If *filled* is True, then this also returns True if one path completely encloses the other (i.e., the paths are treated as filled).

**iter\_bezier(self, \*\*kwargs)**

Iterate over each bezier curve (lines included) in a Path.

**Parameters**

**\*\*kwargs**

Forwarded to *iter\_segments*.

**Yields****B**

[matplotlib.bezier.BezierSegment] The bezier curves that make up the current path. Note in particular that freestanding points are bezier curves of order 0, and lines are bezier curves of order 1 (with two control points).

**code**

[Path.code\_type] The code describing what kind of curve is being returned. Path.MOVETO, Path.LINETO, Path.CURVE3, Path.CURVE4 correspond to bezier curves with 1, 2, 3, and 4 control points (respectively). Path.CLOSEPOLY is a Path.LINETO with the control points correctly chosen based on the start/end points of the current stroke.

**iter\_segments**(*self*, *transform=None*, *remove\_nans=True*, *clip=None*, *snap=False*,  
*stroke\_width=1.0*, *simplify=None*, *curves=True*, *sketch=None*)

Iterate over all curve segments in the path.

Each iteration returns a pair (*vertices*, *code*), where *vertices* is a sequence of 1-3 coordinate pairs, and *code* is a *Path* code.

Additionally, this method can provide a number of standard cleanups and conversions to the path.

**Parameters****transform**

[None or *Transform*] If not None, the given affine transformation will be applied to the path.

**remove\_nans**

[bool, optional] Whether to remove all NaNs from the path and skip over them using MOVETO commands.

**clip**

[None or (float, float, float, float), optional] If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

**clip**

[None or bool, optional] If True, snap all nodes to pixels; if False, don't snap them. If None, snap if the path contains only segments parallel to the x or y axes, and no more than 1024 of them.

**stroke\_width**

[float, optional] The width of the stroke being drawn (used for path snapping).

**simplify**

[None or bool, optional] Whether to simplify the path by removing vertices that do not affect its appearance. If None, use the `should_simplify` attribute. See also `rcParams["path.simplify"]` (default: True) and `rcParams["path.simplify_threshold"]` (default: 0.111111111111).

**curves**

[bool, optional] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

**sketch**

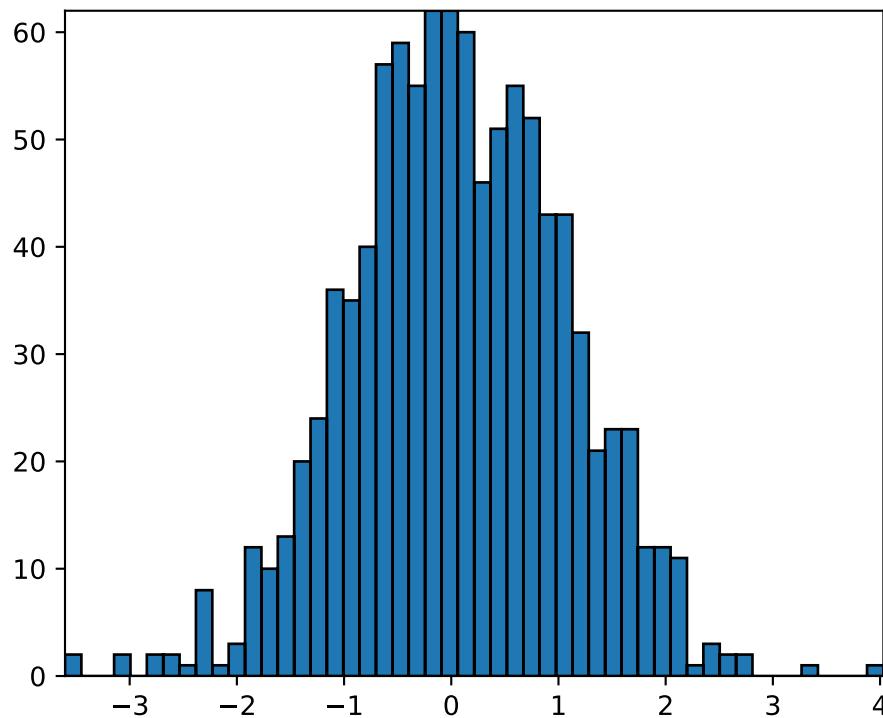

[None or sequence, optional] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

**classmethod make\_compound\_path(\*args)**

Make a compound path from a list of Path objects. Blindly removes all Path.STOP control points.

**classmethod make\_compound\_path\_from\_polys(XY)**

Make a compound path object to draw a number of polygons with equal numbers of sides XY is a (numpolys x numsides x 2) numpy array of vertices. Return object is a `Path`

**property readonly**

`True` if the `Path` is read-only.

**property should\_simplify**

`True` if the vertices array should be simplified.

**property simplify\_threshold**

The fraction of a pixel difference below which vertices will be simplified out.

**to\_polygons(*self*, *transform=None*, *width=0*, *height=0*, *closed\_only=True*)**

Convert this path to a list of polygons or polylines. Each polygon/polyline is an Nx2 array of vertices. In other words, each polygon has no MOVETO instructions or curves. This is useful for displaying in backends that do not support compound paths or Bezier curves.

If *width* and *height* are both non-zero then the lines will be simplified so that vertices outside of (0, 0), (*width*, *height*) will be clipped.

If *closed\_only* is `True` (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If *closed\_only* is `False`, any unclosed polygons in the path will be returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

**transformed(*self*, *transform*)**

Return a transformed copy of the path.

**See also:**

**`matplotlib.transforms.TransformedPath`**

A specialized path class that will cache the transformed result and automatically update when the transform changes.

**classmethod unit\_circle()**

Return the readonly `Path` of the unit circle.

For most cases, `Path.circle()` will be what you want.

**classmethod unit\_circle\_righthalf()**

Return a `Path` of the right half of a unit circle.

See `Path.circle` for the reference on the approximation used.

**classmethod unit\_rectangle()**

Return a `Path` instance of the unit rectangle from (0, 0) to (1, 1).

**classmethod unit\_regular\_asterisk(*numVertices*)**

Return a `Path` for a unit regular asterisk with the given *numVertices* and radius of 1.0, centered at (0, 0).

**classmethod unit\_regular\_polygon(*numVertices*)**

Return a `Path` instance for a unit regular polygon with the given *numVertices* such that the circumscribing circle has radius 1.0, centered at (0, 0).

**classmethod unit\_regular\_star**(*numVertices*, *innerCircle*=0.5)

Return a [Path](#) for a unit regular star with the given *numVertices* and radius of 1.0, centered at (0, 0).

**property vertices**

The list of vertices in the [Path](#) as an Nx2 numpy array.

**classmethod wedge**(*theta1*, *theta2*, *n*=None)

Return the unit circle wedge from angles *theta1* to *theta2* (in degrees).

*theta2* is unwrapped to produce the shortest wedge within 360 degrees. That is, if *theta2* > *theta1* + 360, the wedge will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

See [Path.arc](#) for the reference on the approximation used.

**matplotlib.path.get\_path\_collection\_extents**(*master\_transform*, *paths*, *transforms*, *offsets*, *offset\_transform*)

Given a sequence of [Paths](#), [Transforms](#) objects, and offsets, as found in a [PathCollection](#), returns the bounding box that encapsulates all of them.

### Parameters

**master\_transform**

[[Transform](#)] Global transformation applied to all paths.

**paths**

[list of [Path](#)]

**transforms**

[list of [Affine2D](#)]

**offsets**

[(N, 2) array-like]

**offset\_transform**

[[Affine2D](#)] Transform applied to the offsets before offsetting the path.

### Notes

The way that *paths*, *transforms* and *offsets* are combined follows the same method as for collections: Each is iterated over independently, so if you have 3 paths, 2 transforms and 1 offset, their combinations are as follows:

(A, A, A), (B, B, A), (C, A, A)

## 18.38 matplotlib.patheffects

Defines classes for path effects. The path effects are supported in `Text`, `Line2D` and `Patch`.

**See also:**

[Path effects guide](#)

**class** `matplotlib.patheffects.AbstractPathEffect` (`offset=0.0, 0.0`)  
 Bases: `object`

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.

### Parameters

#### `offset`

[float, float], default: (0, 0) The (x, y) offset to apply to the path, measured in points.

**draw\_path** (`self, renderer, gc, tpath, affine, rgbFace=None`)

Derived should override this method. The arguments are the same as `matplotlib.backend_bases.RendererBase.draw_path()` except the first argument is a renderer.

**class** `matplotlib.patheffects.Normal` (`offset=0.0, 0.0`)

Bases: `matplotlib.patheffects.AbstractPathEffect`

The "identity" PathEffect.

The Normal PathEffect's sole purpose is to draw the original artist with no special path effect.

### Parameters

#### `offset`

[float, float], default: (0, 0) The (x, y) offset to apply to the path, measured in points.

**class** `matplotlib.patheffects.PathEffectRenderer` (`path_effects, renderer`)

Bases: `matplotlib.backend_bases.RendererBase`

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate `AbstractPathEffect` draw method.

---

**Note:** Not all methods have been overridden on this RendererBase subclass. It may be necessary to add further methods to extend the PathEffects capabilities further.

---

### Parameters

**path\_effects**

[iterable of *AbstractPathEffect*] The path effects which this renderer represents.

**renderer**

[*matplotlib.backend\_bases.RendererBase* subclass]

**copy\_with\_path\_effect** (*self, path\_effects*)

**draw\_markers** (*self, gc, marker\_path, marker\_trans, path, \*args, \*\*kwargs*)

Draw a marker at each of *path*'s vertices (excluding control points).

This provides a fallback implementation of *draw\_markers* that makes multiple calls to *draw\_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters****gc**

[*GraphicsContextBase*] The graphics context.

**marker\_trans**

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans**

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

**draw\_path** (*self, gc, tpath, affine, rgbFace=None*)

Draw a *Path* instance using the given affine transform.

**draw\_path\_collection** (*self, gc, master\_transform, paths, \*args, \*\*kwargs*)

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw\_path\_collection()* that makes multiple calls to *draw\_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods *\_iter\_collection\_raw\_paths()* and *\_iter\_collection()* are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw\_path\_collection()* can be made globally.

**class** *matplotlib.pathEffects.PathPatchEffect* (*offset=0, 0, \*\*kwargs*)

Bases: *matplotlib.pathEffects.AbstractPathEffect*

Draws a `PathPatch` instance whose Path comes from the original PathEffect artist.

## Parameters

### `offset`

[float, float], default: (0, 0)] The (x, y) offset to apply to the path, in points.

### `**kwargs`

All keyword arguments are passed through to the `PathPatch` constructor. The properties which cannot be overridden are "path", "clip\_box" "transform" and "clip\_path".

### `draw_path(self, renderer, gc, tpath, affine, rgbFace)`

Derived should override this method. The arguments are the same as `matplotlib.backend_bases.RendererBase.draw_path()` except the first argument is a renderer.

```
class matplotlib.patheffects.SimpleLineShadow(offset=2, -2, shadow_color='k',
                                              alpha=0.3, rho=0.3,
                                              **kwargs)
```

Bases: `matplotlib.patheffects.AbstractPathEffect`

A simple shadow via a line.

## Parameters

### `offset`

[float, float], default: (2, -2)] The (x, y) offset to apply to the path, in points.

### `shadow_color`

[color, default: 'black'] The shadow color. A value of `None` takes the original artist's color with a scale factor of `rho`.

### `alpha`

[float, default: 0.3] The alpha transparency of the created shadow patch.

### `rho`

[float, default: 0.3] A scale factor to apply to the `rgbFace` color if `shadow_color` is `None`.

### `**kwargs`

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

### `draw_path(self, renderer, gc, tpath, affine, rgbFace)`

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

```
class matplotlib.patheffects.SimplePatchShadow(offset=2, - 2,
                                                shadow_rgbFace=None,
                                                alpha=None, rho=0.3,
                                                **kwargs)
```

Bases: *matplotlib.patheffects.AbstractPathEffect*

A simple shadow via a filled patch.

#### Parameters

##### offset

[float, float], default: (2, -2) The (x, y) offset of the shadow in points.

##### shadow\_rgbFace

[color] The shadow color.

##### alpha

[float, default: 0.3] The alpha transparency of the created shadow patch. <http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html>

##### rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow\_rgbFace* is not specified.

##### \*\*kwargs

Extra keywords are stored and passed through to *AbstractPathEffect*.  
*\_update\_gc()*.

#### draw\_path(*self, renderer, gc, tpath, affine, rgbFace*)

Overrides the standard *draw\_path* to add the shadow offset and necessary color changes for the shadow.

```
class matplotlib.patheffects.Stroke(offset=0, 0, **kwargs)
```

Bases: *matplotlib.patheffects.AbstractPathEffect*

A line based PathEffect which re-draws a stroke.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

#### draw\_path(*self, renderer, gc, tpath, affine, rgbFace*)

Draw the path with updated gc.

```
class matplotlib.patheffects.TickedStroke(offset=0, 0, spacing=10.0, angle=45.0,
                                            length=1.4142135623730951,
                                            **kwargs)
```

Bases: *matplotlib.patheffects.AbstractPathEffect*

A line-based PathEffect which draws a path with a ticked style.

This line style is frequently used to represent constraints in optimization. The ticks may be used to indicate that one side of the line is invalid or to represent a closed boundary of a domain (i.e. a wall or the edge of a pipe).

The spacing, length, and angle of ticks can be controlled.

This line style is sometimes referred to as a hatched line.

See also the contour demo example.

See also the contours in optimization example.

## Parameters

### **offset**

[float, float], default: (0, 0)] The (x, y) offset to apply to the path, in points.

### **spacing**

[float, default: 10.0] The spacing between ticks in points.

### **angle**

[float, default: 45.0] The angle between the path and the tick in degrees. The angle is measured as if you were an ant walking along the curve, with zero degrees pointing directly ahead, 90 to your left, -90 to your right, and 180 behind you.

### **length**

[float, default: 1.414] The length of the tick relative to spacing. Recommended length = 1.414 ( $\sqrt{2}$ ) when angle=45, length=1.0 when angle=90 and length=2.0 when angle=60.

### **\*\*kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

## Examples

See `/gallery/misc/tickedstroke_demo`.

**draw\_path** (*self, renderer, gc, tpath, affine, rgbFace*)  
Draw the path with updated gc.

```
class matplotlib.patheffects.withSimplePatchShadow(offset=2,      -      2,
                                                    shadow_rgbFace=None,
                                                    alpha=None,   rho=0.3,
                                                    **kwargs)
```

Bases: `matplotlib.patheffects.SimplePatchShadow`

A shortcut PathEffect for applying `SimplePatchShadow` and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([path_effects.withSimplePatchShadow()])
```

as a shortcut for

```
artist.set_path_effects([path_effects.SimplePatchShadow(),
                        path_effects.Normal()])
```

### Parameters

#### offset

[float, float], default: (2, -2) The (x, y) offset of the shadow in points.

#### shadow\_rgbFace

[color] The shadow color.

#### alpha

[float, default: 0.3] The alpha transparency of the created shadow patch. <http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html>

#### rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow\_rgbFace* is not specified.

#### \*\*kwargs

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

#### draw\_path(*self, renderer, gc, tpath, affine, rgbFace*)

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

#### class `matplotlib.path_effects.withStroke`(*offset=0, 0, \*\*kwargs*)

Bases: `matplotlib.path_effects.Stroke`

A shortcut PathEffect for applying `Stroke` and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([path_effects.withStroke()])
```

as a shortcut for

```
artist.set_path_effects([path_effects.Stroke(),
                        path_effects.Normal()])
```

The path will be stroked with its `gc` updated with the given keyword arguments, i.e., the keyword arguments should be valid `gc` parameter values.

**draw\_path** (*self, renderer, gc, tpath, affine, rgbFace*)

Draw the path with updated gc.

```
class matplotlib.patheffects.withTickedStroke(offset=0,          0,
                                              spacing=10.0,        10.0,
                                              angle=45.0,         angle=45.0,
                                              length=1.4142135623730951,
                                              **kwargs)
```

Bases: *matplotlib.patheffects.TickedStroke*

A shortcut PathEffect for applying *TickedStroke* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([path_effects.withTickedStroke()])
```

as a shortcut for

```
artist.set_path_effects([path_effects.TickedStroke(),
                        path_effects.Normal()])
```

## Parameters

### offset

[float, float], default: (0, 0)] The (x, y) offset to apply to the path, in points.

### spacing

[float, default: 10.0] The spacing between ticks in points.

### angle

[float, default: 45.0] The angle between the path and the tick in degrees. The angle is measured as if you were an ant walking along the curve, with zero degrees pointing directly ahead, 90 to your left, -90 to your right, and 180 behind you.

### length

[float, default: 1.414] The length of the tick relative to spacing. Recommended length = 1.414 (sqrt(2)) when angle=45, length=1.0 when angle=90 and length=2.0 when angle=60.

### \*\*kwargs

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

### Examples

See /gallery/misc/tickedstroke\_demo.

**draw\_path**(self, renderer, gc, tpath, affine, rgbFace)  
Draw the path with updated gc.

## 18.39 matplotlib.pyplot pyplot

### 18.39.1 Pyplot function overview

---

*pyplot*

*matplotlib.pyplot* is a state-based interface to matplotlib.

---

### matplotlib.pyplot

*matplotlib.pyplot* is a state-based interface to matplotlib. It provides a MATLAB-like way of plotting.

pyplot is mainly intended for interactive plots and simple cases of programmatic plot generation:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
plt.plot(x, y)
```

The object-oriented API is recommended for more complex plots.

### Functions

---

<code>acorr(x, *[data])</code>	Plot the autocorrelation of <i>x</i> .
<code>angle_spectrum(x[, Fs, Fc, window, pad_to, ...])</code>	Plot the angle spectrum.
<code>annotate(text, xy, *args, **kwargs)</code>	Annotate the point <i>xy</i> with text <i>text</i> .
<code>arrow(x, y, dx, dy, **kwargs)</code>	Add an arrow to the Axes.
<code>autoscale([enable, axis, tight])</code>	Autoscale the axis view to the data (toggle).
<code>autumn()</code>	Set the colormap to 'autumn'.
<code>axes([arg])</code>	Add an axes to the current figure and make it the current axes.
<code>axhline([y, xmin, xmax])</code>	Add a horizontal line across the axis.
<code>axhspan(ymin, ymax[, xmin, xmax])</code>	Add a horizontal span (rectangle) across the Axes.

---

continues on next page

Table 188 – continued from previous page

<code>axis(*args[, emit])</code>	Convenience method to get or set some axis properties.
<code>axline(xy1[, xy2, slope])</code>	Add an infinitely long straight line.
<code>axvline([x, ymin, ymax])</code>	Add a vertical line across the Axes.
<code>axvspan(xmin, xmax[, ymin, ymax])</code>	Add a vertical span (rectangle) across the Axes.
<code>bar(x, height[, width, bottom, align, data])</code>	Make a bar plot.
<code>bar_label(container[, labels, fmt, ...])</code>	Label a bar plot.
<code>barbs(*args[, data])</code>	Plot a 2D field of barbs.
<code>barh(y, width[, height, left, align])</code>	Make a horizontal bar plot.
<code>bone()</code>	Set the colormap to 'bone'.
<code>box([on])</code>	Turn the axes box on or off on the current axes.
<code>boxplot(x[, notch, sym, vert, whis, ...])</code>	Make a box and whisker plot.
<code>broken_barh(xranges, yrange, \*[, data])</code>	Plot a horizontal sequence of rectangles.
<code>cla()</code>	Clear the current axes.
<code>clabel(CS[, levels])</code>	Label a contour plot.
<code>clf()</code>	Clear the current figure.
<code>clim([vmin, vmax])</code>	Set the color limits of the current image.
<code>close([fig])</code>	Close a figure window.
<code>cohere(x, y[, NFFT, Fs, Fc, detrend, ...])</code>	Plot the coherence between $x$ and $y$ .
<code>colorbar([mappable, cax, ax])</code>	Add a colorbar to a plot.
<code>connect(s, func)</code>	Bind function <i>func</i> to event <i>s</i> .
<code>contour(*args[, data])</code>	Plot contour lines.
<code>contourf(*args[, data])</code>	Plot filled contours.
<code>cool()</code>	Set the colormap to 'cool'.
<code>copper()</code>	Set the colormap to 'copper'.
<code>csd(x, y[, NFFT, Fs, Fc, detrend, window, ...])</code>	Plot the cross-spectral density.
<code>delaxes([ax])</code>	Remove an <code>Axes</code> (defaulting to the current axes) from its figure.
<code>disconnect(cid)</code>	Disconnect the callback with id <i>cid</i> .
<code>draw()</code>	Redraw the current figure.
<code>draw_if_interactive()</code>	Redraw the current figure if in interactive mode.
<code>errorbar(x, y[, yerr, xerr, fmt, ecolor, ...])</code>	Plot $y$ versus $x$ as lines and/or markers with attached errorbars.
<code>eventplot(positions[, orientation, ...])</code>	Plot identical parallel lines at the given positions.
<code>figimage(X[, xo, yo, alpha, norm, cmap, ...])</code>	Add a non-resampled image to the figure.
<code>figlegend(*args, \*\*kwargs)</code>	Place a legend on the figure.
<code>fignum_exists(num)</code>	Return whether the figure with the given id exists.
<code>figtext(x, y, s[, fontdict])</code>	Add text to figure.
<code>figure([num, figsize, dpi, facecolor, ...])</code>	Create a new figure, or activate an existing figure.
<code>fill(*args[, data])</code>	Plot filled polygons.
<code>fill_between(x, y1[, y2, where, ...])</code>	Fill the area between two horizontal curves.
<code>fill_betweenx(y, x1[, x2, where, step, ...])</code>	Fill the area between two vertical curves.
<code>findobj([o, match, include_self])</code>	Find artist objects.
<code>flag()</code>	Set the colormap to 'flag'.

continues on next page

Table 188 – continued from previous page

<code>gca(*kwargs)</code>	Get the current Axes, creating one if necessary.
<code>gcf()</code>	Get the current figure.
<code>gci()</code>	Get the current colorable artist.
<code>get(obj, *args, **kwargs)</code>	Return the value of an <i>Artist</i> 's <i>property</i> , or print all of them.
<code>get_current_fig_manager()</code>	Return the figure manager of the current figure.
<code>get_fignames()</code>	Return a list of existing figure labels.
<code>get_fignum()</code>	Return a list of existing figure numbers.
<code>get_plot_commands()</code>	Get a sorted list of all of the plotting commands.
<code>getp(obj, *args, **kwargs)</code>	Return the value of an <i>Artist</i> 's <i>property</i> , or print all of them.
<code>ginput([n, timeout, show_clicks, mouse_add, ...])</code>	Blocking call to interact with a figure.
<code>gray()</code>	Set the colormap to 'gray'.
<code>grid([b, which, axis])</code>	Configure the grid lines.
<code>hexbin(x, y[, C, gridsize, bins, xscale, ...])</code>	Make a 2D hexagonal binning plot of points <i>x</i> , <i>y</i> .
<code>hist(x[, bins, range, density, weights, ...])</code>	Plot a histogram.
<code>hist2d(x, y[, bins, range, density, ...])</code>	Make a 2D histogram plot.
<code>hlines(y, xmin, xmax[, colors, linestyles, ...])</code>	Plot horizontal lines at each <i>y</i> from <i>xmin</i> to <i>xmax</i> .
<code>hot()</code>	Set the colormap to 'hot'.
<code>hsv()</code>	Set the colormap to 'hsv'.
<code>imread(fname[, format])</code>	Read an image from a file into an array.
<code>imsave(fname, arr, *kwargs)</code>	Save an array as an image file.
<code>imshow(X[, cmap, norm, aspect, ...])</code>	Display data as an image, i.e., on a 2D regular raster.
<code>inferno()</code>	Set the colormap to 'inferno'.
<code>install_repl_displayhook()</code>	Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.
<code>ioff()</code>	Disable interactive mode.
<code>ion()</code>	Enable interactive mode.
<code>isinteractive()</code>	Return whether plots are updated after every plotting command.
<code>jet()</code>	Set the colormap to 'jet'.
<code>legend(*args, **kwargs)</code>	Place a legend on the Axes.
<code>locator_params([axis, tight])</code>	Control behavior of major tick locators.
<code>loglog(*args, **kwargs)</code>	Make a plot with log scaling on both the x and y axis.
<code>magma()</code>	Set the colormap to 'magma'.
<code>magnitude_spectrum(x[, Fs, Fc, window, ...])</code>	Plot the magnitude spectrum.
<code>margins(*margins[, x, y, tight])</code>	Set or retrieve autoscaling margins.
<code>matshow(A[, fignum])</code>	Display an array as a matrix in a new figure window.
<code>minorticks_off()</code>	Remove minor ticks from the axes.
<code>minorticks_on()</code>	Display minor ticks on the axes.

continues on next page

Table 188 – continued from previous page

<code>new_figure_manager</code> (num, \*args, \*\*kwargs)	Create a new figure manager instance.
<code>nipy_spectral()</code>	Set the colormap to 'nipy_spectral'.
<code>pause</code> (interval)	Run the GUI event loop for <i>interval</i> seconds.
<code>pcolor</code> (\*args[, shading, alpha, norm, cmap, ...])	Create a pseudocolor plot with a non-regular rectangular grid.
<code>pcolormesh</code> (\*args[, alpha, norm, cmap, ...])	Create a pseudocolor plot with a non-regular rectangular grid.
<code>phase_spectrum</code> (x[, Fs, Fc, window, pad_to, ...])	Plot the phase spectrum.
<code>pie</code> (x[, explode, labels, colors, autopct, ...])	Plot a pie chart.
<code>pink()</code>	Set the colormap to 'pink'.
<code>plasma()</code>	Set the colormap to 'plasma'.
<code>plot</code> (\*args[, scalex, scaley, data])	Plot y versus x as lines and/or markers.
<code>plot_date</code> (x, y[, fmt, tz, xdate, ydate, data])	Plot coercing the axis to treat floats as dates.
<code>polar</code> (\*args, \*\*kwargs)	Make a polar plot.
<code>prism()</code>	Set the colormap to 'prism'.
<code>psd</code> (x[, NFFT, Fs, Fc, detrend, window, ...])	Plot the power spectral density.
<code>quiver</code> (\*args[, data])	Plot a 2D field of arrows.
<code>quiverkey</code> (Q, X, Y, U, label, \*\*kw)	Add a key to a quiver plot.
<code>rc</code> (group, \*\*kwargs)	Set the current <i>rcParams</i> . <i>group</i> is the grouping for the rc, e.g., for <code>lines.linewidth</code> the group is <code>lines</code> , for <code>axes.facecolor</code> , the group is <code>axes</code> , and so on. Group may also be a list or tuple of group names, e.g., <code>(xtick, ytick)</code> . <i>kwargs</i> is a dictionary attribute name/value pairs, e.g.,:::
<code>rc_context</code> ([rc, fname])	Return a context manager for temporarily changing <i>rcParams</i> .
<code>rcdefaults()</code>	Restore the <i>rcParams</i> from Matplotlib's internal default style.
<code>rgrids</code> ([radii, labels, angle, fmt])	Get or set the radial gridlines on the current polar plot.
<code>savefig</code> (\*args, \*\*kwargs)	Save the current figure.
<code>sca</code> (ax)	Set the current Axes to <i>ax</i> and the current Figure to the parent of <i>ax</i> .
<code>scatter</code> (x, y[, s, c, marker, cmap, norm, ...])	A scatter plot of y vs.
<code>sci</code> (im)	Set the current image.
<code>semilogx</code> (\*args, \*\*kwargs)	Make a plot with log scaling on the x axis.
<code>semilogy</code> (\*args, \*\*kwargs)	Make a plot with log scaling on the y axis.
<code>set_cmap</code> (cmap)	Set the default colormap, and applies it to the current image if any.
<code>setp</code> (obj, \*args, \*\*kwargs)	Set one or more properties on an <i>Artist</i> , or list allowed values.
<code>show</code> (*[block])	Display all open figures.

continues on next page

Table 188 – continued from previous page

<code>specgram(x[, NFFT, Fs, Fc, detrend, window, ...])</code>	Plot a spectrogram.
<code>spring()</code>	Set the colormap to 'spring'.
<code>spy(Z[, precision, marker, markersize, ...])</code>	Plot the sparsity pattern of a 2D array.
<code>stackplot(x, *args[, labels, colors, ...])</code>	Draw a stacked area plot.
<code>stairs(values[, edges, orientation, ...])</code>	A stepwise constant function as a line with bounding edges or a filled plot.
<code>stem(*args[, linefmt, markerfmt, basefmt, ...])</code>	Create a stem plot.
<code>step(x, y, *args[, where, data])</code>	Make a step plot.
<code>streamplot(x, y, u, v[, density, linewidth, ...])</code>	Draw streamlines of a vector flow.
<code>subplot(*args, **kwargs)</code>	Add an Axes to the current figure or retrieve an existing Axes.
<code>subplot2grid(shape, loc[, rowspan, colspan, fig])</code>	Create a subplot at a specific location inside a regular grid.
<code>subplot_mosaic(mosaic, *[, subplot_kw, ...])</code>	Build a layout of Axes based on ASCII art or nested lists.
<code>subplot_tool([targetfig])</code>	Launch a subplot tool window for a figure.
<code>subplots([nrows, ncols, sharex, sharey, ...])</code>	Create a figure and a set of subplots.
<code>subplots_adjust([left, bottom, right, top, ...])</code>	Adjust the subplot layout parameters.
<code>summer()</code>	Set the colormap to 'summer'.
<code>suptitle(t, **kwargs)</code>	Add a centered suptitle to the figure.
<code>switch_backend(newbackend)</code>	Close all open figures and set the Matplotlib backend.
<code>table([cellText, cellColours, cellLoc, ...])</code>	Add a table to an <code>Axes</code> .
<code>text(x, y, s[, fontdict])</code>	Add text to the Axes.
<code>thetaagrids([angles, labels, fmt])</code>	Get or set the theta gridlines on the current polar plot.
<code>tick_params([axis])</code>	Change the appearance of ticks, tick labels, and gridlines.
<code>ticklabel_format(*[, axis, style, ...])</code>	Configure the <code>ScalarFormatter</code> used by default for linear axes.
<code>tight_layout(*[, pad, h_pad, w_pad, rect])</code>	Adjust the padding between and around subplots.
<code>title(label[, fontdict, loc, pad, y])</code>	Set a title for the Axes.
<code>tricontour(*args, **kwargs)</code>	Draw contour lines on an unstructured triangular grid.
<code>tricontourf(*args, **kwargs)</code>	Draw contour regions on an unstructured triangular grid.
<code>tripcolor(*args[, alpha, norm, cmap, vmin, ...])</code>	Create a pseudocolor plot of an unstructured triangular grid.
<code>tripplot(*args, **kwargs)</code>	Draw a unstructured triangular grid as lines and/or markers.
<code>twinx([ax])</code>	Make and return a second axes that shares the <code>x</code> -axis.
<code>twiny([ax])</code>	Make and return a second axes that shares the <code>y</code> -axis.

continues on next page

Table 188 – continued from previous page

<code>uninstall_repl_displayhook()</code>	Uninstall the matplotlib display hook.
<code>violinplot(dataset[, positions, vert, ...])</code>	Make a violin plot.
<code>viridis()</code>	Set the colormap to 'viridis'.
<code>vlines(x, ymin, ymax[, colors, linestyles, ...])</code>	Plot vertical lines at each $x$ from $ymin$ to $ymax$ .
<code>waitForbuttonpress([timeout])</code>	Blocking call to interact with the figure.
<code>winter()</code>	Set the colormap to 'winter'.
<code>xcorr(x, y[, normed, detrend, usevlines, ...])</code>	Plot the cross correlation between $x$ and $y$ .
<code>xkcd([scale, length, randomness])</code>	Turn on <code>xkcd</code> sketch-style drawing mode.
<code>xlabel(xlabel[, fontdict, labelpad, loc])</code>	Set the label for the x-axis.
<code>xlim(*args, **kwargs)</code>	Get or set the x limits of the current axes.
<code>xscale(value, **kwargs)</code>	Set the x-axis scale.
<code>xticks([ticks, labels])</code>	Get or set the current tick locations and labels of the x-axis.
<code>ylabel(ylabel[, fontdict, labelpad, loc])</code>	Set the label for the y-axis.
<code>ylim(*args, **kwargs)</code>	Get or set the y-limits of the current axes.
<code>yscale(value, **kwargs)</code>	Set the y-axis scale.
<code>yticks([ticks, labels])</code>	Get or set the current tick locations and labels of the y-axis.

## matplotlib.pyplot.acorr

`matplotlib.pyplot.acorr(x, *, data=None, **kwargs)`

Plot the autocorrelation of  $x$ .

### Parameters

#### x

[array-like]

#### detrend

[callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to  $x$ . It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

#### normed

[bool, default: True] If True, input vectors are normalised to unit length.

#### usevlines

[bool, default: True] Determines the plot style.

If True, vertical lines are plotted from 0 to the acorr value using `Axes.vlines`. Additionally, a horizontal line is plotted at  $y=0$  using `Axes.axhline`.

If False, markers are plotted at the acorr values using `Axes.plot`.

### maxlags

[int, default: 10] Number of lags to show. If `None`, will return all  $2 * \text{len}(x) - 1$  lags.

### Returns

#### lags

[array (length  $2 * \text{maxlags} + 1$ )] The lag vector.

#### c

[array (length  $2 * \text{maxlags} + 1$ )] The auto correlation vector.

#### line

[`LineCollection` or `Line2D`] `Artist` added to the Axes of the correlation:

- `LineCollection` if `usevlines` is True.
- `Line2D` if `usevlines` is False.

#### b

[`Line2D` or `None`] Horizontal line at 0 if `usevlines` is True `None` `usevlines` is False.

### Other Parameters

#### linestyle

[`Line2D` property, optional] The linestyle for plotting the data points. Only used if `usevlines` is False.

#### marker

[str, default: 'o'] The marker for plotting the data points. Only used if `usevlines` is False.

#### \*\*kwargs

Additional parameters are passed to `Axes.vlines` and `Axes.axhline` if `usevlines` is True; otherwise they are passed to `Axes.plot`.

### Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.acorr`

### `matplotlib.pyplot.angle_spectrum`

```
matplotlib.pyplot.angle_spectrum(x,      Fs=None,      Fc=None,      window=None,
                                  pad_to=None,    sides=None,    *,     data=None,
                                  **kwargs)
```

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of  $x$ . Data is padded to a length of  $pad\_to$  and the windowing function  $window$  is applied to the signal.

#### Parameters

##### **x**

[1-D array or sequence] Array or sequence containing the data.

##### **Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies,  $freqs$ , in cycles per time unit.

##### **window**

[callable or ndarray, default: `window_hanning`] A function or a vector of length  $NFFT$ . To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

##### **sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

##### **pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets  $pad\_to$  equal to the length of the input signal (i.e. no padding).

##### **Fc**

[int, default: 0] The center frequency of  $x$ , which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

#### Returns

**spectrum**

[1-D array] The values for the angle spectrum in radians (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**line**

[*Line2D*] The line created by this function.

**Other Parameters****\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or c	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>dash_joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or ls	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<i>linewidth</i> or lw	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgecolor</i> or mec	color
<i>markeredgewidth</i> or mew	float
<i>markerfacecolor</i> or mfc	color
<i>markerfacecoloralt</i> or mfcalc	color
<i>markersize</i> or ms	float
<i>markevery</i>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<i>path_effects</i>	<i>AbstractPathEffect</i>

continues on

Table 189 – continued from previous page

Property	Description
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

**See also:****`magnitude_spectrum`**

Plots the magnitudes of the corresponding frequencies.

**`phase_spectrum`**

Plots the unwrapped version of this function.

**`specgram`**

Can plot the angle spectrum of segments within the signal in a colormap.

**Notes**

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

**Examples using `matplotlib.pyplot.angle_spectrum`****`matplotlib.pyplot.annotate`**    **annotate**

`matplotlib.pyplot.annotate(text, xy, *args, **kwargs)`

Annotate the point `xy` with text `text`.

In the simplest form, the text is placed at `xy`.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

## Parameters

### text

[str] The text of the annotation.

### xy

[(float, float)] The point  $(x, y)$  to annotate. The coordinate system is determined by *xycoords*.

### xytext

[(float, float), default: *xy*] The position  $(x, y)$  to place the text at. The coordinate system is determined by *textcoords*.

### xycoords

[str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure 距离图形左下角的点数量
'figure pixels'	Pixels from the lower left of the figure 距离图形左下角的像素数量
'figure fraction'	Fraction of figure from lower left 0, 0是图形左下角, 1, 1是右上角
'subfigure points'	Points from the lower left of the subfigure
'subfigure pixels'	Pixels from the lower left of the subfigure
'subfigure fraction'	Fraction of subfigure from lower left
'axes points'	Points from lower left corner of axes 距离轴域左下角的点数量
'axes pixels'	Pixels from lower left corner of axes 距离轴域左下角的像素数量
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	$(\theta, r)$ if not native 'data' coordinates

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g.  $(0, 0)$  would be the lower left corner of the bounding box and  $(0.5, 1)$  would be the center top of the bounding box.
- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where *renderer* is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple (*xcoords*, *ycoords*) specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced Annotations* for more details.

### textcoords

[str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *ycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the <i>xy</i> value
'offset pixels'	Offset (in pixels) from the <i>xy</i> value

### arrowprops

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*. Note that the edge of the arrow pointing to *xytext* will be centered on the text itself and may not point directly to the coordinates given in *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to <i>matplotlib.patches.FancyArrowPatch</i>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

Name	Attrs
'-'	None
'->'	head_length=0.4,head_width=0.2
'-[' '	widthB=1.0,lengthB=0.2,angleB=None
' - '	widthA=1.0,widthB=1.0
'- >'	head_length=0.4,head_width=0.2
'<-'	head_length=0.4,head_width=0.2
'<->'	head_length=0.4,head_width=0.2
'< - '	head_length=0.4,head_width=0.2
'< - >'	head_length=0.4,head_width=0.2
'fancy'	head_length=0.4,head_width=0.4,tail_width=0.4
'simple'	head_length=0.5,head_width=0.5,tail_width=0.2
'wedge'	tail_width=0.3,shrink_factor=0.5

Valid keys for `FancyArrowPatch` are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for <code>matplotlib.patches.PathPatch</code>

Defaults to None, i.e. no arrow is drawn.

### `annotation_clip`

[bool or None, default: None] Whether to draw the annotation when the annotation point `xy` is outside the axes area.

- If `True`, the annotation will only be drawn when `xy` is within the axes.
- If `False`, the annotation will always be drawn.
- If `None`, the annotation will only be drawn when `xy` is within the axes and `xycoords` is 'data'.

### `**kwargs`

Additional kwargs are passed to `Text`.

### Returns

#### `Annotation`

**See also:**

[Advanced Annotations](#)

## Examples using `matplotlib.pyplot.annotate`

- [sphx\\_glr\\_gallery\\_text\\_labels\\_and\\_annotations\\_mathtext\\_examples.py](#)
- [Pyplot tutorial](#)
- [Annotations](#)

## `matplotlib.pyplot.arrow`

`matplotlib.pyplot.arrow(x, y, dx, dy, **kwargs)`

Add an arrow to the Axes.

This draws an arrow from  $(x, y)$  to  $(x+dx, y+dy)$ .

### Parameters

#### **x, y**

[float] The x and y coordinates of the arrow base.

#### **dx, dy**

[float] The length of the arrow along x and y direction.

#### **width**

[float, default: 0.001] Width of full arrow tail.

#### **length\_includes\_head**

[bool, default: False] True if head is to be counted in calculating the length.

#### **head\_width**

[float or None, default: 3\*width] Total width of the full arrow head.

#### **head\_length**

[float or None, default: 1.5\*head\_width] Length of arrow head.

#### **shape**

[{'full', 'left', 'right'}, default: 'full'] Draw the left-half, right-half, or full arrow.

#### **overhang**

[float, default: 0] Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head\_starts\_at\_zero**

[bool, default: False] If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**\*\*kwargs**

*Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	unknown
<i>capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or ec	color or None or 'auto'
<i>facecolor</i> or fc	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or ls	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<i>linewidth</i> or lw	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

**Returns****FancyArrow**

The created *FancyArrow* object.

## Notes

The resulting arrow is affected by the Axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use `annotate()` for example:

```
>>> ax.annotate("",
    xy=(0.5, 0.5), xytext=(0, 0),
    arrowprops=dict(arrowstyle="->"))
```

## Examples using `matplotlib.pyplot.arrow`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_arrow\_demo.py

## `matplotlib.pyplot.autoscale`

`matplotlib.pyplot.autoscale(enable=True, axis='both', tight=None)`

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

### Parameters

#### `enable`

[bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

#### `axis`

[{'both', 'x', 'y'}, default: 'both'] Which axis to operate on.

#### `tight`

[bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to `autoscale_view` (regardless of its value); see the description of its behavior there.

## Examples using `matplotlib.pyplot.autoscale`

## `matplotlib.pyplot.autumn`

`matplotlib.pyplot.autumn()`

Set the colormap to 'autumn'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using `matplotlib.pyplot.autumn`

#### `matplotlib.pyplot.axes`

`matplotlib.pyplot.axes(arg=None, **kwargs)`

Add an axes to the current figure and make it the current axes.

Call signatures:

```
plt.axes()  
plt.axes(rect, projection=None, polar=False, **kwargs)  
plt.axes(ax)
```

#### Parameters

##### `arg`

[None or 4-tuple] The exact behavior of this function depends on the type:

- *None*: A new full window axes is added using `subplot(**kwargs)`.
- 4-tuple of floats `rect = [left, bottom, width, height]`. A new axes is added with dimensions `rect` in normalized (0, 1) units using `add_axes` on the current figure.

##### `projection`

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the `Axes`. `str` is the name of a custom projection, see `projections`. The default None results in a 'rectilinear' projection.

##### `polar`

[bool, default: False] If True, equivalent to `projection='polar'`.

##### `sharex, sharey`

[`Axes`, optional] Share the x or y `axis` with `sharex` and/or `sharey`. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

##### `label`

[str] A label for the returned axes.

#### Returns

##### `Axes, or a subclass of Axes`

The returned axes class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used.

#### Other Parameters

**\*\*kwargs**

This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or float
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	float or None
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<code>Figure</code>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	[left, bottom, width, height] or <code>Bbox</code>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str

continues on next

Table 191 – continued from previous page

Property	Description
<code>xlim</code>	(bottom: float, top: float)
<code>xmargin</code>	float greater than -0.5
<code>xscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>xticklabels</code>	unknown
<code>xticks</code>	unknown
<code>ybound</code>	unknown
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...} or <code>ScaleBase</code>
<code>yticklabels</code>	unknown
<code>yticks</code>	unknown
<code>zorder</code>	float

See also:

`Figure.add_axes`  
`pyplot.subplot`  
`Figure.add_subplot`  
`Figure.subplots`  
`pyplot.subplots`

## Notes

If the figure already has axes with key (`args`, `kwargs`) then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes `label` attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

## Examples

```
# Creating a new full window axes
plt.axes()

# Creating a new axes with specified dimensions and some kwargs
plt.axes((left, bottom, width, height), facecolor='w')
```

## `matplotlib.pyplot.axhline`

`matplotlib.pyplot.axhline(y=0, xmin=0, xmax=1, **kwargs)`

Add a horizontal line across the axis.

### Parameters

#### y

[float, default: 0] y position in data coordinates of the horizontal line.

#### xmin

[float, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

#### xmax

[float, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

### Returns

`Line2D`

### Other Parameters

#### \*\*kwargs

Valid keyword arguments are `Line2D` properties, with the exception of 'transform':

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

See also:

**`hlines`**

Add horizontal lines in data coordinates.

**`axhspan`**

Add a horizontal span (rectangle) across the axis.

**`axline`**

Add a line with an arbitrary slope.

**Examples**

- draw a thick red hline at 'y' = 0 that spans the xrange:

```
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at 'y' = 1 that spans the xrange:

```
>>> axhline(y=1)
```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

```
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

**Examples using `matplotlib.pyplot.axhline`**

- sphx\_glr\_gallery\_pyplots\_axline.py
- sphx\_glr\_gallery\_misc\_zorder\_demo.py

**`matplotlib.pyplot.axhspan`**

`matplotlib.pyplot.axhspan(ymin, ymax, xmin=0, xmax=1, **kwargs)`

Add a horizontal span (rectangle) across the Axes.

The rectangle spans from `ymin` to `ymax` vertically, and, by default, the whole x-axis horizontally. The x-span can be set using `xmin` (default: 0) and `xmax` (default: 1) which are in axis units; e.g. `xmin = 0.5` always refers to the middle of the x-axis regardless of the limits set by `set_xlim`.

**Parameters****`ymin`**

[float] Lower y-coordinate of the span, in data units.

**`ymax`**

[float] Upper y-coordinate of the span, in data units.

**xmin**

[float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.

**xmax**

[float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

**Returns****Polygon**

Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

**Other Parameters****\*\*kwargs**

[*Polygon* properties]

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float or None
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>

continues on next page

Table 193 – continued from previous page

Property	Description
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

See also:

**`axvspan`**

Add a vertical span across the Axes.

## Examples using `matplotlib.pyplot.axhspan`

### `matplotlib.pyplot.axis`

`matplotlib.pyplot.axis (*args, emit=True, **kwargs)`

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

### Parameters

#### `xmin, xmax, ymin, ymax`

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

#### `option`

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as <code>True</code> .
'off'	Turn off axis lines and labels. Same as <code>False</code> .
'equal'	'Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code> . Explicit data limits may not be respected in this case.'
'scaled'	'Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code> . Additionally, further autoscaling will be disabled.'
'tight'	'Set limits just large enough to show all data, then disable further autoscaling.'
'auto'	'Automatic scaling (fill plot box with data).'
'image'	'scaled' with axis limits equal to data limits.
'square'	'Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin == ymax-ymin</code> .

### emit

[bool, default: `True`] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

### Returns

#### `xmin, xmax, ymin, ymax`

[float] The axis limits.

### See also:

`matplotlib.axes.Axes.set_xlim`

`matplotlib.axes.Axes.set_ylim`

- *Pyplot tutorial*

## matplotlib.pyplot.axline

`matplotlib.pyplot.axline(xy1, xy2=None, *, slope=None, **kwargs)`

Add an infinitely long straight line.

The line can be defined either by two points `xy1` and `xy2`, or by one point `xy1` and a `slope`.

This draws a straight line "on the screen", regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, `slope` should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points `xy1`, `xy2` for non-linear scales.

The `transform` keyword argument only applies to the points `xy1`, `xy2`. The `slope` (if given) is always in data coordinates. This can be used e.g. with `ax.transAxes` for drawing grid lines with a fixed slope.

### Parameters

#### `xy1, xy2`

[float, float] Points for the line to pass through. Either `xy2` or `slope` has to be given.

#### `slope`

[float, optional] The slope of the line. Either `xy2` or `slope` has to be given.

### Returns

#### `Line2D`

### Other Parameters

#### `**kwargs`

Valid kwargs are `Line2D` properties

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3), bool or float array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)

continues on next page

Table 194 – continued from previous page

Property	Description
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

**See also:****`axhline`**

for horizontal lines

**`axvline`**

for vertical lines

## Examples

Draw a thick red line passing through (0, 0) and (1, 1):

```
>>> axline((0, 0), (1, 1), linewidth=4, color='r')
```

## Examples using matplotlib.pyplot.axline

- sphx\_glr\_gallery\_pyplots\_axline.py

## matplotlib.pyplot.axvline

`matplotlib.pyplot.axvline(x=0, ymin=0, ymax=1, **kwargs)`

Add a vertical line across the Axes.

### Parameters

#### x

[float, default: 0] x position in data coordinates of the vertical line.

#### ymin

[float, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

#### ymax

[float, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

### Returns

`Line2D`

### Other Parameters

#### \*\*kwargs

Valid keyword arguments are `Line2D` properties, with the exception of 'transform':

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or aa	bool

continues on next page

Table 195 – continued from previous page

Property	Description
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

**See also:****`vlines`**

Add vertical lines in data coordinates.

**`axvspan`**

Add a vertical span (rectangle) across the axis.

**`axline`**

Add a line with an arbitrary slope.

**Examples**

- draw a thick red vline at  $x = 0$  that spans the yrangle:

```
>>> axvline(linewidth=4, color='r')
```

- draw a default vline at  $x = 1$  that spans the yrangle:

```
>>> axvline(x=1)
```

- draw a default vline at  $x = .5$  that spans the middle half of the yrangle:

```
>>> axvline(x=.5, ymin=0.25, ymax=0.75)
```

**Examples using `matplotlib.pyplot.axvline`**

- sphx\_glr\_gallery\_pyplots\_axline.py

**matplotlib.pyplot.axvspan**

`matplotlib.pyplot.axvspan`(*xmin*, *xmax*, *ymin*=0, *ymax*=1, \*\**kwargs*)

Add a vertical span (rectangle) across the Axes.

The rectangle spans from *xmin* to *xmax* horizontally, and, by default, the whole y-axis vertically. The y-span can be set using *ymin* (default: 0) and *ymax* (default: 1) which are in axis units; e.g. *ymin* = 0.5 always refers to the middle of the y-axis regardless of the limits set by `set_ylim`.

**Parameters****xmin**

[float] Lower x-coordinate of the span, in data units.

**xmax**

[float] Upper x-coordinate of the span, in data units.

**ymin**

[float, default: 0] Lower y-coordinate of the span, in y-axis units (0-1).

**ymax**

[float, default: 1] Upper y-coordinate of the span, in y-axis units (0-1).

**Returns****Polygon**

Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

**Other Parameters****\*\*kwargs**

[[Polygon](#) properties]

<code>visible</code>	bool
<code>zorder</code>	float

See also:

[`axhspan`](#)

Add a horizontal span across the Axes.

## Examples

Draw a vertical, green, translucent rectangle from  $x = 1.25$  to  $x = 1.55$  that spans the yrange of the Axes.

```
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

## Examples using `matplotlib.pyplot.axvspan`

### `matplotlib.pyplot.bar`

`matplotlib.pyplot.bar`(*x*, *height*, *width*=0.8, *bottom*=None, \*, *align*='center', *data*=None, \*\**kwargs*)

Make a bar plot.

The bars are positioned at *x* with the given *alignment*. Their dimensions are given by *height* and *width*. The vertical baseline is *bottom* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

#### Parameters

##### **x**

[float or array-like] The x coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

##### **height**

[float or array-like] The height(s) of the bars.

##### **width**

[float or array-like, default: 0.8] The width(s) of the bars.

##### **bottom**

[float or array-like, default: 0] The y coordinate(s) of the bars bases.

##### **align**

[{'center', 'edge'}, default: 'center'] Alignment of the bars to the *x* coordinates:

- 'center': Center the base on the *x* positions.
- 'edge': Align the left edges of the bars with the *x* positions.

To align the bars on the right edge pass a negative *width* and *align*='edge'.

#### Returns

***BarContainer***

Container with all the bars and optionally errorbars.

**Other Parameters****color**

[color or list of color, optional] The colors of the bar faces.

**edgecolor**

[color or list of color, optional] The colors of the bar edges.

**linewidth**

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

**tick\_label**

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

**xerr, yerr**

[float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (Default)

See [/gallery/statistics/errorbar\\_features](#) for an example on the usage of `xerr` and `yerr`.

**ecolor**

[color or list of color, default: 'black'] The line color of the errorbars.

**capsize**

[float, default: `rcParams["errorbar.capsize"]` (default: 0.0)] The length of the error bar caps in points.

**error\_kw**

[dict, optional] Dictionary of kwargs to be passed to the `errorbar` method. Values of `ecolor` or `capsize` defined here take precedence over the independent kwargs.

**log**

[bool, default: False] If *True*, set the y-axis to be log scale.

**\*\*kwargs**[*Rectangle* properties]

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>

<code>zorder</code>	float

**See also:****`barh`**

Plot a horizontal bar plot.

### Notes

Stacked bars can be achieved by passing individual *bottom* values per bar. See /gallery/lines\_bars\_and\_markers/bar\_stacked.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception).

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

### Examples using `matplotlib.pyplot.bar`

- sphx\_glr\_gallery\_misc\_table\_demo.py
- *Pyplot tutorial*
- *Sample plots in Matplotlib*

### `matplotlib.pyplot.bar_label`

`matplotlib.pyplot.bar_label(container, labels=None, *, fmt='%g', label_type='edge', padding=0, **kwargs)`

Label a bar plot.

Adds labels to bars in the given *BarContainer*. You may need to adjust the axis limits to fit the labels.

#### Parameters

##### `container`

[*BarContainer*] Container with all the bars and optionally errorbars, likely returned from *bar* or *barh*.

##### `labels`

[array-like, optional] A list of label texts, that should be displayed. If not given, the label texts will be the data values formatted with *fmt*.

##### `fmt`

[str, default: '%g'] A format string for the label.

##### `label_type`

[{'edge', 'center'}, default: 'edge'] The label type. Possible values:

- 'edge': label placed at the end-point of the bar segment, and the value displayed will be the position of that end-point.

- 'center': label placed in the center of the bar segment, and the value displayed will be the length of that segment. (useful for stacked bars, i.e., /gallery/lines\_bars\_and\_markers/bar\_label\_demo)

**padding**

[float, default: 0] Distance of label from the end of the bar, in points.

**\*\*kwargs**

Any remaining keyword arguments are passed through to `Axes.annotate`.

**Returns****list of `Text`**

A list of `Text` instances for the labels.

**Examples using `matplotlib.pyplot.bar_label`****`matplotlib.pyplot.barbs`**

`matplotlib.pyplot.barbs(*args, data=None, **kw)`

Plot a 2D field of barbs.

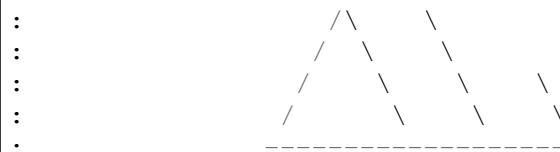

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where  $X, Y$  define the barb locations,  $U, V$  define the barb directions, and  $C$  optionally sets the color.

All arguments may be 1D or 2D.  $U, V, C$  may be masked arrays, but masked  $X, Y$  are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as shown schematically below:

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also [https://en.wikipedia.org/wiki/Wind\\_barb](https://en.wikipedia.org/wiki/Wind_barb).

## Parameters

### X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using *X*, *Y* = np.meshgrid(*X*, *Y*). In this case len(*X*) and len(*Y*) must match the column and row dimensions of *U* and *V*.

### U, V

[1D or 2D array-like] The x and y components of the barb shaft.

### C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

### length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

### pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

### barbcolor

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override *facecolor*.

### flagcolor

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override *facecolor*. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

### sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

#### **fill\_empty**

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

#### **rounding**

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

#### **barb\_increments**

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

#### **flip\_barb**

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as  $U$  and  $V$ .

### Returns

#### **barbs**

[*Barbs*]

### Other Parameters

#### **\*\*kwargs**

The barbs can further be customized using `PolyCollection` keyword arguments:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	array-like or scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray or None
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clim</code>	(vmin: float, vmax: float)
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>cmap</code>	<code>Colormap</code> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<code>Figure</code>
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '!', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	(N, 2) or (2,) array-like
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

## Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception).

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

## Examples using `matplotlib.pyplot.barbs`

### `matplotlib.pyplot.bart`

`matplotlib.pyplot.bart`(*y*, *width*, *height*=0.8, *left*=None, \*, *align*='center', \*\**kwargs*)

Make a horizontal bar plot.

The bars are positioned at *y* with the given *alignment*. Their dimensions are given by *width* and *height*. The horizontal baseline is *left* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

#### Parameters

##### **y**

[float or array-like] The y coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

##### **width**

[float or array-like] The width(s) of the bars.

##### **height**

[float or array-like, default: 0.8] The heights of the bars.

##### **left**

[float or array-like, default: 0] The x coordinates of the left sides of the bars.

##### **align**

[{'center', 'edge'}, default: 'center'] Alignment of the base to the y coordinates\*:

- 'center': Center the bars on the y positions.
- 'edge': Align the bottom edges of the bars with the y positions.

To align the bars on the top edge pass a negative *height* and *align*='edge'.

#### Returns

***BarContainer***

Container with all the bars and optionally errorbars.

**Other Parameters****color**

[color or list of color, optional] The colors of the bar faces.

**edgecolor**

[color or list of color, optional] The colors of the bar edges.

**linewidth**

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

**tick\_label**

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

**xerr, yerr**

[float or array-like of shape(N,) or shape(2, N), optional] If not `None`, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- `shape(N,)`: symmetric +/- values for each bar
- `shape(2, N)`: Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- `None`: No errorbar. (default)

See `/gallery/statistics/errorbar_features` for an example on the usage of `xerr` and `yerr`.

**ecolor**

[color or list of color, default: 'black'] The line color of the errorbars.

**capsize**

[float, default: `rcParams["errorbar.capsize"]` (default: 0.0)] The length of the error bar caps in points.

**error\_kw**

[dict, optional] Dictionary of kwargs to be passed to the `errorbar` method. Values of `ecolor` or `capsize` defined here take precedence over the independent kwargs.

**log**

[bool, default: False] If `True`, set the x-axis to be log scale.

**\*\*kwargs**[*Rectangle* properties]

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool

<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**See also:****`bar`**

Plot a vertical bar plot.

### Notes

Stacked bars can be achieved by passing individual *left* values per bar. See [/gallery/lines\\_bars\\_and\\_markers/horizontal\\_barchart\\_distribution](#).

### Examples using `matplotlib.pyplot.bart`

#### `matplotlib.pyplot.bone`

`matplotlib.pyplot.bone()`

Set the colormap to 'bone'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using `matplotlib.pyplot.bone`

#### `matplotlib.pyplot.box`

`matplotlib.pyplot.box(on=None)`

Turn the axes box on or off on the current axes.

##### Parameters

###### `on`

[bool or None] The new `Axes` box state. If `None`, toggle the state.

See also:

`matplotlib.axes.Axes.set_frame_on()`

`matplotlib.axes.Axes.get_frame_on()`

### Examples using `matplotlib.pyplot.box`

## matplotlib.pyplot.boxplot

```
matplotlib.pyplot.boxplot(x, notch=None, sym=None, vert=None, whis=None, positions=None, widths=None, patch_artist=None, bootstrap=None, usermedians=None, conf_intervals=None, meanline=None, showmeans=None, showcaps=None, showbox=None, showfliers=None, boxprops=None, labels=None, flierprops=None, medianprops=None, meanprops=None, capprops=None, whiskerprops=None, manage_ticks=True, autorange=False, zorder=None, *, data=None)
```

Make a box and whisker plot.

Make a box and whisker plot for each column of  $x$  or each vector in sequence  $x$ . The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

### Parameters

#### **x**

[Array or a sequence of vectors.] The input data.

#### **notch**

[bool, default: False] Whether to draw a notched box plot (`True`), or a rectangular box plot (`False`). The notches represent the confidence interval (CI) around the median. The documentation for `bootstrap` describes how the locations of the notches are computed by default, but their locations may also be overridden by setting the `conf_intervals` parameter.

---

**Note:** In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

---

#### **sym**

[str, optional] The default symbol for flier points. An empty string ("") hides the fliers. If `None`, then the fliers default to 'b+'. More control is provided by the `flierprops` parameter.

#### **vert**

[bool, default: True] If `True`, draws vertical boxes. If `False`, draw horizontal boxes.

#### **whis**

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above  $Q1 - whis * (Q3 - Q1)$ , and the upper whisker at the highest datum below  $Q3 + whis * (Q3 - Q1)$ , where

Q1 and Q3 are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data.

In the edge case where `Q1 == Q3`, `whis` is automatically set to (0, 100) (cover the whole range of the data) if `autorange` is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

### **bootstrap**

[int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If `bootstrap` is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, `bootstrap` specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

### **usermedians**

[1D array-like, optional] A 1D array-like of length `len(x)`. Each entry that is not `None` forces the value of the median for the corresponding dataset. For entries that are `None`, the medians are computed by Matplotlib as normal.

### **conf\_intervals**

[array-like, optional] A 2D array-like of shape `(len(x), 2)`. Each entry that is not `None` forces the location of the corresponding notch (which is only drawn if `notch` is `True`). For entries that are `None`, the notches are computed by the method specified by the other parameters (e.g., `bootstrap`).

### **positions**

[array-like, optional] The positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where N is the number of boxes to be drawn.

### **widths**

[float or array-like] The widths of the boxes. The default is 0.5, or 0.15\*(distance between extreme positions), if that is smaller.

### **patch\_artist**

[bool, default: False] If `False` produces boxes with the Line2D artist. Otherwise, boxes are drawn with Patch artists.

### **labels**

[sequence, optional] Labels for each dataset (one per dataset).

**manage\_ticks**

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

**autorange**

[bool, default: False] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

**meanline**

[bool, default: False] If `True` (and `showmeans` is `True`), will try to render the mean as a line spanning the full width of the box according to `meanprops` (see below). Not recommended if `shownotches` is also True. Otherwise, means will be shown as points.

**zorder**

[float, default: `Line2D.zorder = 2`] The zorder of the boxplot.

**Returns****dict**

A dictionary mapping each component of the boxplot to a list of the `Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

**Other Parameters****showcaps**

[bool, default: True] Show the caps on the ends of whiskers.

**showbox**

[bool, default: True] Show the central box.

**showfliers**

[bool, default: True] Show the outliers beyond the caps.

### showmeans

[bool, default: False] Show the arithmetic means.

### capprops

[dict, default: None] The style of the caps.

### boxprops

[dict, default: None] The style of the box.

### whiskerprops

[dict, default: None] The style of the whiskers.

### flierprops

[dict, default: None] The style of the fliers.

### medianprops

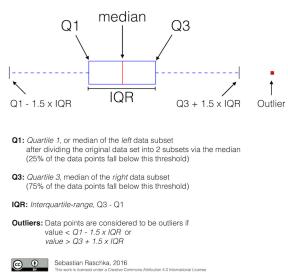

[dict, default: None] The style of the median.

### meanprops

[dict, default: None] The style of the mean.

## Notes

Box plots provide insight into distribution properties of the data. However, they can be challenging to interpret for the unfamiliar reader. The figure below illustrates the different visual features of a box plot.

The whiskers mark the range of the non-outlier data. The most common definition of non-outlier is  $[Q1 - 1.5 \times IQR, Q3 + 1.5 \times IQR]$ , which is also the default in this function. Other whisker meanings can be applied via the `whis` parameter.

See [Box plot](#) on Wikipedia for further information.

Violin plots ([violinplot](#)) add even more detail about the statistical distribution by plotting the kernel density estimation (KDE) as an estimation of the probability density function.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

---

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.boxplot`

### `matplotlib.pyplot.broken_barh`

`matplotlib.pyplot.broken_barh(xranges, yranges, *, data=None, **kwargs)`

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of `xranges`. All rectangles have the same vertical position and size defined by `yranges`.

This is a convenience function for instantiating a `BrokenBarHCollection`, adding it to the Axes and autoscaling the view.

#### Parameters

##### `xranges`

[sequence of tuples  $(xmin, xwidth)$ ] The x-positions and extends of the rectangles.  
For each tuple  $(xmin, xwidth)$  a rectangle is drawn from  $xmin$  to  $xmin + xwidth$ .

##### `yranges`

$(ymin, yheight)$ ] The y-position and extend for all the rectangles.

#### Returns

`BrokenBarHCollection`

#### Other Parameters

##### `**kwargs`

[`BrokenBarHCollection` properties] Each `kwarg` can be either a single argument applying to all rectangles, e.g.:

```
facecolors='black'
```

or a sequence of arguments over which is cycled, e.g.:

```
facecolors=('black', 'blue')
```

would create interleaving black and blue rectangles.

Supported keywords:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	array-like or scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray or None
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clim</code>	(vmin: float, vmax: float)
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>cmap</code>	<code>Colormap</code> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<code>Figure</code>
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	(N, 2) or (2,) array-like
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

## Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception).

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

## Examples using `matplotlib.pyplot.broken_barh`

### `matplotlib.pyplot.cla`

`matplotlib.pyplot.cla()`

Clear the current axes.

## Examples using `matplotlib.pyplot.cla`

### `matplotlib.pyplot.clabel`

`matplotlib.pyplot.clabel(CS, levels=None, **kwargs)`

Label a contour plot.

Adds labels to line contours in given *ContourSet*.

#### Parameters

##### `CS`

[*ContourSet* instance] Line contours to label.

##### `levels`

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

##### `**kwargs`

All other parameters are documented in *clabel*.

### Examples using `matplotlib.pyplot.clabel`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

### matplotlib.pyplot.clf

```
matplotlib.pyplot.clf()
```

Clear the current figure.

### Examples using `matplotlib.pyplot.clf`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

### matplotlib.pyplot.clim

```
matplotlib.pyplot.clim(vmin=None, vmax=None)
```

Set the color limits of the current image.

If either `vmin` or `vmax` is `None`, the image min/max respectively will be used for color scaling.

If you want to set the `clim` of multiple images, use `set_clim` on every image, for example:

```
for im in gca().get_images():
    im.set_clim(0, 0.5)
```

### Examples using `matplotlib.pyplot.clim`

### matplotlib.pyplot.close

```
matplotlib.pyplot.close(fig=None)
```

Close a figure window.

#### Parameters

##### `fig`

[`None` or `int` or `str` or `Figure`] The figure to close. There are a number of ways to specify this:

- `None`: the current figure
- `Figure`: the given `Figure` instance
- `int`: a figure number
- `str`: a figure name
- `'all'`: all figures

## Examples using `matplotlib.pyplot.close`

- sphx\_glr\_gallery\_misc\_multiprocess\_sgskip.py

## `matplotlib.pyplot.cohere`

`matplotlib.pyplot.cohere`(*x*, *y*, *NFFT*=256, *Fs*=2, *Fc*=0, *detrend*=<function *detrend\_none* at 0x7f27ec1cf1f0>, *window*=<function *window\_hanning* at 0x7f27ec1c8dc0>, *noverlap*=0, *pad\_to*=None, *sides*='default', *scale\_by\_freq*=None, \*, *data*=None, \*\**kwargs*)

Plot the coherence between *x* and *y*.

Plot the coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx} P_{yy}}$$

### Parameters

#### **Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

#### **window**

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

#### **sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

#### **pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is None, which sets *pad\_to* equal to *NFFT*

#### **NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between blocks.

**Fc**

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns****Cxy**

[1-D array] The coherence vector.

**freqs**

[1-D array] The frequencies for the elements in *Cxy*.

**Other Parameters****\*\*kwargs**

Keyword arguments control the `Line2D` properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or aa	bool
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None

continues on

Table 201 – continued from previous page

Property	Description
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'

## Examples using `matplotlib.pyplot.cohere`

### `matplotlib.pyplot.colorbar`

`matplotlib.pyplot.colorbar` (*mappable=None*, *cax=None*, *ax=None*, *\*\*kw*)

Add a colorbar to a plot.

#### Parameters

##### **mappable**

The `matplotlib.cm.ScalarMappable` (i.e., `AxesImage`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure.colorbar` method but optional for the `pyplot.colorbar` function, which sets the default to the current image.

Note that one can create a `ScalarMappable` "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),  
            ax=ax)
```

##### **cax**

[`Axes`, optional] Axes into which the colorbar will be drawn.

##### **ax**

[`Axes`, list of `Axes`, optional] One or more parent axes from which space for a new colorbar axes will be stolen, if *cax* is `None`. This has no effect if *cax* is set.

##### **use\_gridspec**

[bool, optional] If *cax* is `None`, a new *cax* is created as an instance of `Axes`. If *ax* is an instance of `Subplot` and *use\_gridspec* is `True`, *cax* is created as an instance of `Subplot` using the `gridspec` module.

## Returns

### colorbar

[[Colorbar](#)] See also its base class, [ColorbarBase](#).

## Notes

Additional keyword arguments are of two kinds:

axes properties:

### location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

### orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

### fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

### shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

### aspect

[float, default: 20] Ratio of long to short dimensions.

### pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

### anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

### panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Property	Description
<code>extend</code>	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<code>extendfrac</code>	{None, 'auto', length, lengths} If set to <i>None</i> , both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when <code>spacing</code> is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when <code>spacing</code> is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
<code>extenderect</code>	bool If <i>False</i> the minimum and maximum colorbar extensions will be triangular (the default). If <i>True</i> the extensions will be rectangular.
<code>spacing</code>	{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<code>ticks</code>	<i>None</i> or list of ticks or Locator If None, ticks are determined automatically from the input.
<code>format</code>	<i>None</i> or str or Formatter If None, <code>ScalarFormatter</code> is used. If a format string is given, e.g., '%.3f', that is used. An alternative <code>Formatter</code> may be given instead.
<code>drawedges</code>	bool Whether to draw lines at color boundaries.
<code>label</code>	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Property	Description
<code>boundaries</code>	<i>None</i> or a sequence
<code>values</code>	<i>None</i> or a sequence which must be of length 1 less than the sequence of <code>boundaries</code> . For each region delimited by adjacent entries in <code>boundaries</code> , the colormapped to the corresponding value in <code>values</code> will be used.

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

The `shrink` kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if `cax` is specified, it determines the size of the colorbar and `shrink` and `aspect` kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images ( $\text{alpha} < 1$ ) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

- [\*Image tutorial\*](#)
- [\*Tight Layout guide\*](#)

## `matplotlib.pyplot.connect`

`matplotlib.pyplot.connect(s, func)`

Bind function `func` to event `s`.

### Parameters

`s`

[str] One of the following events ids:

- 'button\_press\_event'
- 'button\_release\_event'
- 'draw\_event'
- 'key\_press\_event'
- 'key\_release\_event'
- 'motion\_notify\_event'
- 'pick\_event'
- 'resize\_event'

- 'scroll\_event'
- 'figure\_enter\_event',
- 'figure\_leave\_event',
- 'axes\_enter\_event',
- 'axes\_leave\_event'
- 'close\_event'.

### func

[callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the `inaxes` attribute of the event will be set to the `Axes` the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See `KeyEvent` and `MouseEvent` for more info.

### Returns

#### cid

A connection id that can be used with `FigureCanvasBase.mpl_disconnect`.

## Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

## Examples using `matplotlib.pyplot.connect`

- `sphx_glr_gallery_event_handling_coords_demo.py`

## matplotlib.pyplot.contour

```
matplotlib.pyplot.contour(*args, data=None, **kwargs)
```

Plot contour lines.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

### Parameters

#### X, Y

[array-like, optional] The coordinates of the values in `Z`.

`X` and `Y` must both be 2D with the same shape as `Z` (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in `Z` and `len(Y) == N` is the number of rows in `Z`.

If not given, they are assumed to be integer indices, i.e. `X = range(M), Y = range(N)`.

#### Z

[(M, N) array-like] The height values over which the contour is drawn.

#### levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int `n`, use `MaxNLocator`, which tries to automatically choose no more than `n+1` "nice" contour levels between `vmin` and `vmax`.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

### Returns

`QuadContourSet`

### Other Parameters

#### corner\_mask

[bool, default: `rcParams["contour.corner_mask"]`] (default: `True`)  
Enable/disable corner masking, which only has an effect if `Z` is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

**colors**

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. '`'red'`' instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: '`'viridis'`') A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm**

[`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax**

[float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

**origin**

[{`None`, 'upper', 'lower', 'image'}, default: `None`] Determines the orientation and exact position of Z by specifying the position of `Z[0, 0]`. This is only relevant, if `X, Y` are not given.

- `None`: `Z[0, 0]` is at  $X=0, Y=0$  in the lower left corner.
- 'lower': `Z[0, 0]` is at  $X=0.5, Y=0.5$  in the lower left corner.
- 'upper': `Z[0, 0]` is at  $X=N+0.5, Y=0.5$  in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: '`upper`').

**extent**

[(`x0, x1, y0, y1`), optional] If `origin` is not `None`, then `extent` is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of `Z[0, 0]` is

the center of the pixel, not a corner. If *origin* is *None*, then  $(x_0, y_0)$  is the position of  $Z[0, 0]$ , and  $(x_1, y_1)$  is the position of  $Z[-1, -1]$ .

This argument is ignored if *X* and *Y* are specified in the call to `contour`.

### locator

[`ticker.Locator` subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to `MaxNLocator`.

### extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the `Colormap`. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_over` and `Colormap.set_under`.

---

**Note:** An existing `QuadContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

---

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

### xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

### antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: *True*).

**nchunk**

[int  $\geq 0$ , optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

**linewidths**

[float or array-like, default: `rcParams["contour.linewidth"]`] (default: None) *Only applies to contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

**linestyles**

[`{None, 'solid', 'dashed', 'dashdot', 'dotted'}`, optional] *Only applies to contour*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches**

[list[str], optional] *Only applies to contourf*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

**Notes**

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.
2. `contourf` fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

## Examples using `matplotlib.pyplot.contour`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

### `matplotlib.pyplot.contourf`

`matplotlib.pyplot.contourf(*args, data=None, **kwargs)`

Plot filled contours.

Call signature:

```
contourf([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

#### Parameters

##### `X, Y`

[array-like, optional] The coordinates of the values in `Z`.

`X` and `Y` must both be 2D with the same shape as `Z` (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in `Z` and `len(Y) == N` is the number of rows in `Z`.

If not given, they are assumed to be integer indices, i.e. `X = range(M), Y = range(N)`.

##### `Z`

[(M, N) array-like] The height values over which the contour is drawn.

##### `levels`

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int `n`, use `MaxNLocator`, which tries to automatically choose no more than  $n+1$  "nice" contour levels between `vmin` and `vmax`.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

#### Returns

`QuadContourSet`

#### Other Parameters

##### `corner_mask`

[bool, default: `rcParams["contour.corner_mask"]`] (default: `True`)  
Enable/disable corner masking, which only has an effect if `Z` is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

**colors**

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. '`red`' instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: '`viridis`') A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm**

[`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax**

[float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

**origin**

[`{None, 'upper', 'lower', 'image'}`, default: `None`] Determines the orientation and exact position of `Z` by specifying the position of `Z[0, 0]`. This is only relevant, if `X, Y` are not given.

- `None`: `Z[0, 0]` is at  $X=0, Y=0$  in the lower left corner.
- `'lower'`: `Z[0, 0]` is at  $X=0.5, Y=0.5$  in the lower left corner.
- `'upper'`: `Z[0, 0]` is at  $X=N+0.5, Y=0.5$  in the upper left corner.
- `'image'`: Use the value from `rcParams["image.origin"]` (default: `'upper'`).

**extent**

`[(x0, x1, y0, y1), optional]` If `origin` is not `None`, then `extent` is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of `Z[0, 0]` is the center of the pixel, not a corner. If `origin` is `None`, then `(x0, y0)` is the position of `Z[0, 0]`, and `(x1, y1)` is the position of `Z[-1, -1]`.

This argument is ignored if `X` and `Y` are specified in the call to `contour`.

**locator**

`[ticker.Locator subclass, optional]` The locator is used to determine the contour levels if they are not given explicitly via `levels`. Defaults to `MaxNLocator`.

**extend**

`[{'neither', 'both', 'min', 'max'}, default: 'neither']` Determines the `contourf`-coloring of values that are outside the `levels` range.

If 'neither', values outside the `levels` range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the `levels` range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the `Colormap`. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

---

**Note:** An existing `QuadContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

---

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#008080', '#A0A0A0', '#C0C0C0'], extend='both
                  ↵')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

**xunits, yunits**

`[registered units, optional]` Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**antialiased**

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: `True`).

### **nchunk**

[int  $\geq 0$ , optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

### **linewidths**

[float or array-like, default: `rcParams["contour.linewidth"]`] (default: `None`) *Only applies to contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If `None`, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

### **linestyles**

[`{None, 'solid', 'dashed', 'dashdot', 'dotted'}`, optional] *Only applies to contour*.

If *linestyles* is `None`, the default is `'solid'` unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

### **hatches**

[list[str], optional] *Only applies to contourf*.

A list of cross hatch patterns to use on the filled areas. If `None`, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

## Notes

- `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.
- `contourf` fills intervals that are closed at the top; that is, for boundaries  $z1$  and  $z2$ , the filled region is:

```
z1 < z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

## Examples using `matplotlib.pyplot.contourf`

### `matplotlib.pyplot.cool`

`matplotlib.pyplot.cool()`

Set the colormap to 'cool'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.cool`

### `matplotlib.pyplot.copper`

`matplotlib.pyplot.copper()`

Set the colormap to 'copper'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.copper`

### `matplotlib.pyplot.csd`

`matplotlib.pyplot.csd(x, y, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, nooverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)`

Plot the cross-spectral density.

The cross spectral density  $P_{xy}$  by Welch's average periodogram method. The vectors  $x$  and  $y$  are divided into  $NFFT$  length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The product of the direct FFTs of  $x$  and  $y$  are averaged over each segment to compute  $P_{xy}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < NFFT$  or  $\text{len}(y) < NFFT$ , they will be zero padded to  $NFFT$ .

## Parameters

### x, y

[1-D arrays or sequences] Arrays or sequences containing the data.

### Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

### window

[callable or ndarray, default: *window\_hanning*] A function or a vector of length  $NFFT$ . To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

### sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

### pad\_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to  $NFFT$

### NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

### detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.

### scale\_by\_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz<sup>-1</sup>. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

### **noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between segments.

### **Fc**

[int, default: 0] The center frequency of  $x$ , which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

### **return\_line**

[bool, default: False] Whether to include the line object plotted in the returned values.

## Returns

### **Pxy**

[1-D array] The values for the cross spectrum  $P_{xy}$  before scaling (complex valued).

### **freqs**

[1-D array] The frequencies corresponding to the elements in  $P_{xy}$ .

### **line**

[*Line2D*] The line created by this function. Only returned if *return\_line* is True.

## Other Parameters

### **\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3), bool or float array
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or c	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>dash_joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}

continues on the next page

Table 202 – continued from previous page

Property	Description
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color

<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

**See also:**`psd`is equivalent to setting `y = x`.

## Notes

For plotting, the power is plotted as  $10 \log_{10}(P_{xy})$  for decibels, though  $P_{xy}$  itself is returned.

## References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

## Examples using `matplotlib.pyplot.csd`

### `matplotlib.pyplot.delaxes`

`matplotlib.pyplot.delaxes(ax=None)`

Remove an [Axes](#) (defaulting to the current axes) from its figure.

## Examples using `matplotlib.pyplot.delaxes`

### `matplotlib.pyplot.disconnect`

`matplotlib.pyplot.disconnect(cid)`

Disconnect the callback with id *cid*.

## Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

### Examples using `matplotlib.pyplot.disconnect`

- sphx\_glr\_gallery\_event\_handling\_coords\_demo.py

### `matplotlib.pyplot.draw`

```
matplotlib.pyplot.draw()
```

Redraw the current figure.

This is used to update a figure that has been altered, but not automatically re-drawn. If interactive mode is on (via `ion()`), this should be only rarely needed, but there may be ways to modify the state of a figure without marking it as "stale". Please report these cases as bugs.

This is equivalent to calling `fig.canvas.draw_idle()`, where `fig` is the current figure.

### Examples using `matplotlib.pyplot.draw`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py
- sphx\_glr\_gallery\_mplot3d\_rotate\_axes3d\_sgskip.py

### `matplotlib.pyplot.draw_if_interactive`

```
matplotlib.pyplot.draw_if_interactive()
```

Redraw the current figure if in interactive mode.

**Warning:** End users will typically not have to call this function because the the interactive mode takes care of this.

### Examples using `matplotlib.pyplot.draw_if_interactive`

### `matplotlib.pyplot.errorbar`

```
matplotlib.pyplot.errorbar(x, y, yerr=None, xerr=None, fmt='', ecolor=None,
                           elinewidth=None, capsize=None, barsabove=False,
                           lolims=False, uplims=False, xlolims=False, xuplims=False,
                           errorevery=1, capthick=None, *, data=None, **kwargs)
```

Plot y versus x as lines and/or markers with attached errorbars.

`x`, `y` define the data locations, `xerr`, `yerr` define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use `fmt='none'` to draw errorbars without any data markers.

#### Parameters

**x, y**

[float or array-like] The data positions.

**xerr, yerr**

[float or array-like, shape(N,) or shape(2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar.

Note that all error arrays should have *positive* values.

See /gallery/statistics/errorbar\_features for an example on the usage of `xerr` and `yerr`.

**fmt**

[str, default: "] The format for the data points / data lines. See [plot](#) for details.

Use 'none' (case insensitive) to plot errorbars without any data markers.

**ecolor**

[color, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

**elinewidth**

[float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

**capsize**

[float, default: `rcParams["errorbar.capsize"]` (default: 0.0)] The length of the error bar caps in points.

**capthick**

[float, default: None] An alias to the keyword argument `markeredgewidth` (a.k.a. `mew`). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if `mew` or `markeredgewidth` are given, then they will over-ride `capthick`. This may change in future releases.

**barsabove**

[bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

**lolims, uplims, xlolims, xuplims**

[bool, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be scalars, or array-likes of the same length as *xerr* and *yerr*. To use limits with inverted axes, `set_xlim` or `set_ylim` must be called before `errorbar()`. Note the tricky parameter names: setting e.g. *lolims* to True means that the y-value is a *lower* limit of the True value, so, only an *upward*-pointing arrow will be drawn!

### erroreyevery

[int or (int, int), default: 1] draws error bars on a subset of the data. *erroreyevery* =N draws error bars on the points (*x*[:N], *y*[:N]). *erroreyevery* =(start, N) draws error bars on the points (*x*[start::N], *y*[start::N]). e.g. *erroreyevery*=(6, 3) adds error bars to the data at (*x*[6], *x*[9], *x*[12], *x*[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

### Returns

#### *ErrorbarContainer*

The container contains:

- *plotline*: `Line2D` instance of x, y plot markers and/or line.
- *caplines*: A tuple of `Line2D` instances of the error bar caps.
- *barlinecols*: A tuple of `LineCollection` with the horizontal and vertical error ranges.

### Other Parameters

#### \*\*kwargs

All other keyword arguments are passed on to the `plot` call drawing the markers. For example, this code makes big red squares with thick green edges:

```
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red',
          mec='green', ms=20, mew=4)
```

where *mfc*, *mec*, *ms* and *mew* are aliases for the longer property names, *markerfacecolor*, *markeredgecolor*, *markersize* and *markeredgewidth*.

Valid kwargs for the marker properties are `Line2D` properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<code>Bbox</code>

<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

## Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *y*, *xerr*, *yerr*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

## Examples using `matplotlib.pyplot.errorbar`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_errorbar\_limits\_simple.py

## `matplotlib.pyplot.eventplot`

```
matplotlib.pyplot.eventplot(positions, orientation='horizontal', lineoffsets=1,
                             linelengths=1, linewidths=None, colors=None,
                             linestyles='solid', *, data=None, **kwargs)
```

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

### Parameters

#### **positions**

[array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to *lineoffsets*, *linelengths*, *colors* and *linestyles*.

Note that *positions* can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

#### **orientation**

[{'horizontal', 'vertical'}, default: 'horizontal'] The direction of the event sequence:

- 'horizontal': the events are arranged horizontally. The indicator lines are vertical.
- 'vertical': the events are arranged vertically. The indicator lines are horizontal.

**lineoffsets**

[float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to *orientation*.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**linelengths**

[float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from *lineoffset* - *linelength*/2 to *lineoffset* + *linelength*/2).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**linewidths**

[float or array-like, default: `rcParams["lines.linewidth"]` (default: 1.5)] The line width(s) of the event lines, in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**colors**

[color or list of colors, default: `rcParams["lines.color"]` (default: 'C0')] The color(s) of the event lines.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**linestyles**

[str or tuple or list of such values, default: 'solid'] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

`(offset, onoffseq),`

where *onoffseq* is an even length tuple of on and off ink in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**\*\*kwargs**

Other keyword arguments are line collection properties. See `LineCollection` for a list of the valid properties.

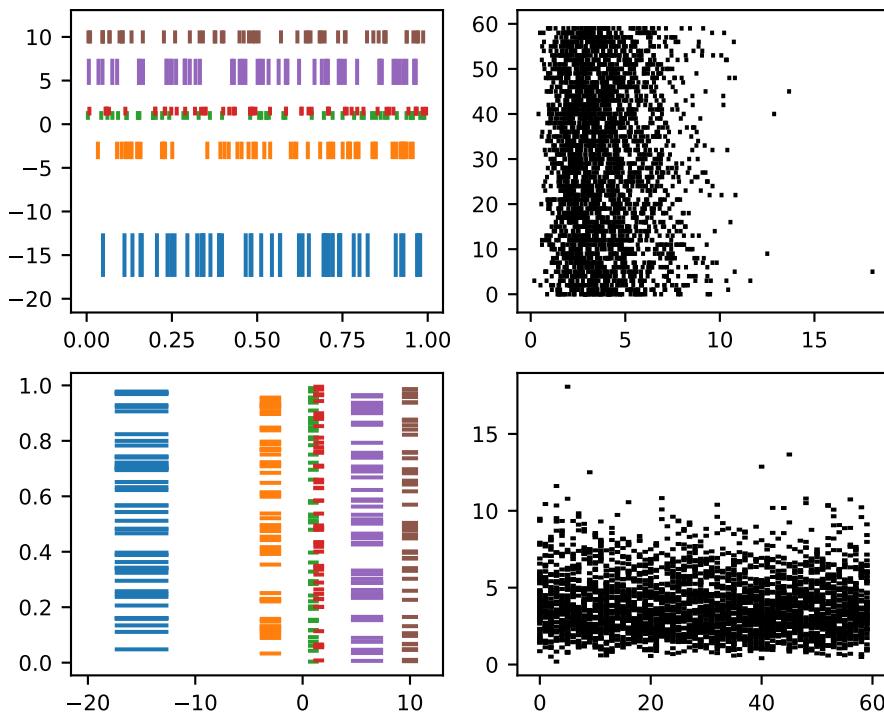

**Returns****list of `EventCollection`**

The `EventCollection` that were added.

## Notes

For *linelengths*, *linewidths*, *colors*, and *linestyles*, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as *positions*, and each value will be applied to the corresponding row of the array.

## Examples

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *positions*, *lineoffsets*, *linelengths*, *linewidths*, *colors*, *linestyles*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s in data*).

---

## Examples using `matplotlib.pyplot.eventplot`

### `matplotlib.pyplot.figimage`

```
matplotlib.pyplot.figimage(X, xo=0, yo=0, alpha=None, norm=None, cmap=None,
                           vmin=None, vmax=None, origin=None, resize=False,
                           **kwargs)
```

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

#### Parameters

##### X

The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

##### xo, yo

[int] The x/y image offset in pixels.

##### alpha

[None or float] The alpha blending value.

##### norm

[`matplotlib.colors.Normalize`] A `Normalize` instance to map the luminance to the interval [0, 1].

##### cmap

[str or `matplotlib.colors.Colormap`, default: `rcParams["image.cmap"]`] (default: 'viridis') The colormap to use.

##### vmin, vmax

[float] If *norm* is not given, these values set the data limits for the colormap.

##### origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]`] (default: 'upper') Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

##### resize

[bool] If *True*, resize the figure to match the given image size.

#### Returns

`matplotlib.image.FigureImage`

### Other Parameters

#### `**kwargs`

Additional kwargs are `Artist` kwargs passed on to `FigureImage`.

### Notes

`figimage` complements the Axes image (`imshow`) which will be resampled to fit the current Axes. If you want a resampled image to fill the entire figure, you can define an `Axes` with extent [0, 0, 1, 1].

### Examples

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

## Examples using `matplotlib.pyplot.figimage`

### `matplotlib.pyplot.figlegend`

`matplotlib.pyplot.figlegend(*args, **kwargs)`

Place a legend on the figure.

Call signatures:

```
figlegend()
figlegend(labels)
figlegend(handles, labels)
```

The call signatures correspond to these three different ways to use this method:

#### 1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
fig.figlegend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
fig.figlegend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Figure.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

## 2. Labeling existing plot elements

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
ax1.plot([1, 3, 5], color='blue')
ax2.plot([2, 4, 6], color='red')
fig.figlegend(['the blues', 'the reds'])
```

Note: This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

## 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
fig.figlegend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

### Parameters

#### handles

[list of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

#### labels

[list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

### Returns

#### `Legend`

### Other Parameters

**loc**

[str or pair of floats, default: `rcParams["legend.loc"]`] (default: 'best') ('best' for axes, 'upper right' for figures) The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor**

[`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox (`x`, `y`, `width`, `height`) that the legend is placed in. To put the legend in the best location in

the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple  $(x, y)$  places the corner of the legend specified by *loc* at  $x, y$ . For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

### **ncol**

[int, default: 1] The number of columns that the legend has.

### **prop**

[None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

### **fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

### **labelcolor**

[str or list] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

### **numpoints**

[int, default: *rcParams["legend.numpoints"]* (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

### **scatterpoints**

[int, default: *rcParams["legend.scatterpoints"]* (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

### **scatteryoffsets**

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

### **markerscale**

[float, default: *rcParams["legend.markerscale"]* (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst**

[bool, default: True] If *True*, legend marker is placed to the left of the legend label.  
If *False*, legend marker is placed to the right of the legend label.

**frameon**

[bool, default: `rcParams["legend.frameon"]` (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox**

[bool, default: `rcParams["legend.fancybox"]` (default: True)] Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.

**shadow**

[bool, default: `rcParams["legend.shadow"]` (default: False)] Whether to draw a shadow behind the legend.

**framealpha**

[float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

**facecolor**

["inherit" or color, default: `rcParams["legend.facecolor"]` (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor**

["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

**mode**

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

**bbox\_transform**

[None or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox\_to\_anchor*). For a value of None (default) the Axes' `transAxes` transform will be used.

**title**

[str or None] The legend's title. Default is no title (None).

**title\_fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]`] (default: None) The font size of the legend's title.

### **borderpad**

[float, default: `rcParams["legend.borderpad"]`] (default: 0.4) The fractional whitespace inside the legend border, in font-size units.

### **labelspacing**

[float, default: `rcParams["legend.labelspacing"]`] (default: 0.5) The vertical space between the legend entries, in font-size units.

### **handlelength**

[float, default: `rcParams["legend.handlelength"]`] (default: 2.0) The length of the legend handles, in font-size units.

### **handletextpad**

[float, default: `rcParams["legend.handletextpad"]`] (default: 0.8) The pad between the legend handle and text, in font-size units.

### **borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]`] (default: 0.5) The pad between the axes and legend border, in font-size units.

### **columnspacing**

[float, default: `rcParams["legend.columnspacing"]`] (default: 2.0) The spacing between columns, in font-size units.

### **handler\_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

## See also:

## Notes

Some artists are not supported by this function. See [`Legend guide`](#) for details.

**Examples using `matplotlib.pyplot.figlegend`****matplotlib.pyplot.ignum\_exists**`matplotlib.pyplot.ignum_exists(num)`

Return whether the figure with the given id exists.

**Examples using `matplotlib.pyplot.ignum_exists`****matplotlib.pyplot.figtext**`matplotlib.pyplot.figtext(x, y, s, fontdict=None, **kwargs)`

Add text to figure.

**Parameters****x, y**[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.**s**

[str] The text string.

**fontdict**[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as `kwargs` override the corresponding ones given in `fontdict`.**Returns****Text****Other Parameters****\*\*kwargs**[`Text` properties] Other miscellaneous text parameters.

`Axes.text`

`pyplot.text`

## Examples using `matplotlib.pyplot.figtext`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_fonts\_demo.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_fonts\_demo\_kw.py

## `matplotlib.pyplot.figure`

```
matplotlib.pyplot.figure(num=None, figsize=None, dpi=None, facecolor=None,  
                      edgecolor=None, frameon=True, FigureClass=<class 'mat-  
                      plotlib.figure.Figure'>, clear=False, **kwargs)
```

Create a new figure, or activate an existing figure.

### Parameters

#### `num`

[int or str or `Figure`, optional] A unique identifier for the figure.

If a figure with that identifier already exists, this figure is made active and returned. An integer refers to the `Figure.number` attribute, a string refers to the figure label.

If there is no figure with the identifier or `num` is not given, a new figure is created, made active and returned. If `num` is an int, it will be used for the `Figure.number` attribute, otherwise, an auto-generated integer value is used (starting at 1 and incremented for each new figure). If `num` is a string, the figure label and the window title is set to this value.

#### `figsize`

[(float, float), default: `rcParams["figure.figsize"]`] (default: [6.4, 4.8]) Width, height in inches.

#### `dpi`

[float, default: `rcParams["figure.dpi"]`] (default: 100.0) The resolution of the figure in dots-per-inch.

#### `facecolor`

[color, default: `rcParams["figure.facecolor"]`] (default: 'white') The background color.

#### `edgecolor`

[color, default: `rcParams["figure.edgecolor"]`] (default: 'white') The border color.

#### `frameon`

[bool, default: True] If False, suppress drawing the figure frame.

## FigureClass

[subclass of *Figure*] Optionally use a custom *Figure* instance.

### clear

[bool, default: False] If True and the figure already exists, then it is cleared.

### tight\_layout

[bool or dict, default: `rcParams["figure.autolayout"]` (default: False)] If False use `subplotpars`. If True adjust subplot parameters using `tight_layout` with default padding. When providing a dict containing the keys pad, w\_pad, h\_pad, and rect, the default `tight_layout` paddings will be overridden.

### constrained\_layout

[bool, default: `rcParams["figure.constrained_layout.use"]` (default: False)] If True use constrained layout to adjust positioning of plot elements. Like `tight_layout`, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with `add_subplot` or `subplot2grid`.)

### \*\*kwargs : optional

See *Figure* for other possible arguments.

## Returns

### Figure

The *Figure* instance returned will also be passed to `new_figure_manager` in the backends, which allows to hook custom *Figure* classes into the pyplot interface. Additional kwargs will be passed to the *Figure* init function.

## Notes

If you are creating many figures, make sure you explicitly call `pyplot.close` on the figures you are not using, because this will enable pyplot to properly clean up the memory.

`rcParams` defines the default values, which can be modified in the matplotlibrc file.

## Examples using `matplotlib.pyplot.figure`

- *Frame grabbing*
- `sphx_glr_gallery_misc_hyperlinks_sgskip.py`
- `sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py`
- `sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py`

- sphx\_glr\_gallery\_user\_interfaces\_svg\_histogram\_sgskip.py
- sphx\_glr\_gallery\_user\_interfaces\_toolmanager\_sgskip.py

## matplotlib.pyplot.fill

```
matplotlib.pyplot.fill (*args, data=None, **kwargs)  
    Plot filled polygons.
```

### Parameters

#### \*args

[sequence of x, y, [color]] Each polygon is defined by the lists of x and y positions of its nodes, optionally followed by a *color* specifier. See [matplotlib.colors](#) for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple x, y, [color] groups.

For example, each of the following is legal:

```
ax.fill(x, y)                      # a polygon with default  
    ↪color  
ax.fill(x, y, "b")                  # a blue polygon  
ax.fill(x, y, x2, y2)              # two polygons  
ax.fill(x, y, "b", x2, y2, "r")    # a blue and a red polygon
```

#### data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y, e.g.:

```
ax.fill("time", "signal",  
       data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

### Returns

list of *Polygon*

### Other Parameters

#### \*\*kwargs

[*Polygon* properties]

## Notes

Use `fill_between()` if you would like to fill the region between two curves.

## Examples using `matplotlib.pyplot.fill`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

### `matplotlib.pyplot.fill_between`

```
matplotlib.pyplot.fill_between(x, y1, y2=0, where=None, interpolate=False,
                               step=None, *, data=None, **kwargs)
```

Fill the area between two horizontal curves.

The curves are defined by the points  $(x, y1)$  and  $(x, y2)$ . This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using `where`.

By default, the edges connect the given points directly. Use `step` if the filling should be a step function, i.e. constant in between  $x$ .

#### Parameters

##### `x`

[array (length N)] The x coordinates of the nodes defining the curves.

##### `y1`

[array (length N) or scalar] The y coordinates of the nodes defining the first curve.

##### `y2`

[array (length N) or scalar, default: 0] The y coordinates of the nodes defining the second curve.

##### `where`

[array of bool (length N), optional] Define `where` to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates  $x[where]$ . More precisely, fill between  $x[i]$  and  $x[i+1]$  if `where[i]` and `where[i+1]`. Note that this definition implies that an isolated `True` value between two `False` values in `where` will not result in filling. Both sides of the `True` position remain unfilled due to the adjacent `False` values.

##### `interpolate`

[bool, default: False] This option is only relevant if `where` is used and the two curves are crossing each other.

Semantically, `where` is often used for  $y1 > y2$  or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the  $x$

array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

### step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *x*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval ( $x[i-1], x[i]$ ) has the value  $y[i]$ .
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval ( $x[i], x[i+1]$ ) has the value  $y[i]$ .
- 'mid': Steps occur half-way between the *x* positions.

### Returns

#### *PolyCollection*

A *PolyCollection* containing the plotted polygons.

### Other Parameters

#### \*\*kwargs

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description

[`fill\_between`](#)

Fill between two sets of y-values.

[`fill\_betweenx`](#)

Fill between two sets of x-values.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y1`, `y2`, `where`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.fill_between`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_mathtext\_examples.py

### `matplotlib.pyplot.fill_betweenx`

`matplotlib.pyplot.fill_betweenx(y, x1, x2=0, where=None, step=None, interpolate=False, *, data=None, **kwargs)`

Fill the area between two vertical curves.

The curves are defined by the points ( $y, x1$ ) and ( $y, x2$ ). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between  $y$ .

#### Parameters

##### `y`

[array (length N)] The  $y$  coordinates of the nodes defining the curves.

##### `x1`

[array (length N) or scalar] The  $x$  coordinates of the nodes defining the first curve.

##### `x2`

[array (length N) or scalar, default: 0] The  $x$  coordinates of the nodes defining the second curve.

##### `where`

[array of bool (length N), optional] Define *where* to exclude some vertical regions from being filled. The filled regions are defined by the coordinates  $y[where]$ . More precisely, fill between  $y[i]$  and  $y[i+1]$  if  $where[i]$  and  $where[i+1]$ . Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

##### `interpolate`

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for  $x1 > x2$  or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the  $y$  array. Such a polygon cannot describe the above semantics close to the intersection. The  $y$ -sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

**step**

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *y*. The value determines where the step will occur:

- 'pre': The *y* value is continued constantly to the left from every *x* position, i.e. the interval ( $x[i-1], x[i]$ ] has the value  $y[i]$ .
- 'post': The *y* value is continued constantly to the right from every *x* position, i.e. the interval [ $x[i], x[i+1]$ ) has the value  $y[i]$ .
- 'mid': Steps occur half-way between the *x* positions.

**Returns*****PolyCollection***

A *PolyCollection* containing the plotted polygons.

**Other Parameters****\*\*kwargs**

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns array-like or scalar or None

**See also:****`fill_between`**

Fill between two sets of y-values.

**`fill_betweenx`**

Fill between two sets of x-values.

**Notes**

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `y`, `x1`, `x2`, `where`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

**Examples using `matplotlib.pyplot.fill_betweenx`****`matplotlib.pyplot.findobj`**

`matplotlib.pyplot.findobj(o=None, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

**Parameters**

**match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`.  
The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include\_self**

[bool] Include *self* in the list to be checked for a match.

**Returns****list of *Artist*****Examples using `matplotlib.pyplot.findobj`****`matplotlib.pyplot.flag`**

`matplotlib.pyplot.flag()`

Set the colormap to 'flag'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.flag`****`matplotlib.pyplot.gca`**

`matplotlib.pyplot.gca(**kwargs)`

Get the current Axes, creating one if necessary.

The following kwargs are supported for ensuring the returned Axes adheres to the given projection etc., and for Axes creation if the active Axes does not exist:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array

Table 207 – continued from previous page

Property	Description
<code>yticks</code>	unknown
<code>zorder</code>	float

### Examples using `matplotlib.pyplot.gca`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

### `matplotlib.pyplot.gcf`

`matplotlib.pyplot.gcf()`

Get the current figure.

If no current figure exists, a new one is created using `figure()`.

### Examples using `matplotlib.pyplot.gcf`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_arrow\_demo.py
- sphx\_glr\_gallery\_misc\_agg\_buffer.py

### `matplotlib.pyplot.gci`

`matplotlib.pyplot.gci()`

Get the current colorable artist.

Specifically, returns the current `ScalarMappable` instance (Image created by `imshow` or `figimage`, `Collection` created by `pcolor` or `scatter`, etc.), or `None` if no such instance has been defined.

The current image is an attribute of the current Axes, or the nearest earlier Axes in the current figure that contains an image.

### Notes

Historically, the only colorable artists were images; hence the name `gci` (get current image).

### Examples using `matplotlib.pyplot.gci`

#### `matplotlib.pyplot.get`

```
matplotlib.pyplot.get(obj, *args, **kwargs)
```

Return the value of an *Artist*'s *property*, or print all of them.

##### Parameters

###### `obj`

[*Artist*] The queried artist; e.g., a `Line2D`, a `Text`, or an `Axes`.

###### `property`

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If it is None (or unset), it prints all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

##### See also:

#### `setp`

### Examples using `matplotlib.pyplot.get`

#### `matplotlib.pyplot.get_current_fig_manager`

```
matplotlib.pyplot.get_current_fig_manager()
```

Return the figure manager of the current figure.

The figure manager is a container for the actual backend-depended window that displays the figure on screen.

If no current figure exists, a new one is created, and its figure manager is returned.

##### Returns

`FigureManagerBase` or backend-dependent subclass thereof

## Examples using `matplotlib.pyplot.get_current_fig_manager`

### `matplotlib.pyplot.get_fignames`

`matplotlib.pyplot.get_fignames()`

Return a list of existing figure labels.

## Examples using `matplotlib.pyplot.get_fignames`

### `matplotlib.pyplot.get_fignum`

`matplotlib.pyplot.get_fignum()`

Return a list of existing figure numbers.

## Examples using `matplotlib.pyplot.get_fignum`

### `matplotlib.pyplot.get_plot_commands`

`matplotlib.pyplot.get_plot_commands()`

Get a sorted list of all of the plotting commands.

## Examples using `matplotlib.pyplot.get_plot_commands`

### `matplotlib.pyplot.getp`

`matplotlib.pyplot.getp(obj, *args, **kwargs)`

Return the value of an `Artist`'s `property`, or print all of them.

#### Parameters

##### `obj`

[`Artist`] The queried artist; e.g., a `Line2D`, a `Text`, or an `Axes`.

##### `property`

[str or None, default: None] If `property` is 'somename', this function returns `obj.get_somename()`.

If it is None (or unset), it prints all gettable properties from `obj`. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

See also:

[setp](#)

### Examples using `matplotlib.pyplot.getp`

- [sphx\\_glr\\_gallery\\_misc\\_set\\_and\\_get.py](#)
- [Artist tutorial](#)

## `matplotlib.pyplot.ginput`

```
matplotlib.pyplot.ginput (n=1,           timeout=30,           show_clicks=True,
                        mouse_add=<MouseButton.LEFT: 1>, mouse_pop=<MouseButton.RIGHT: 3>,
                        mouse_stop=<MouseButton.MIDDLE: 2>)
```

Blocking call to interact with a figure.

Wait until the user clicks *n* times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments `mouse_add`, `mouse_pop` and `mouse_stop`.

### Parameters

#### **n**

[int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

#### **timeout**

[float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

#### **show\_clicks**

[bool, default: True] If True, show a red cross at the location of each click.

#### **mouse\_add**

[`MouseButton` or None, default: `MouseButton.LEFT`] Mouse button used to add points.

**mouse\_pop**

[`MouseButton` or None, default: `MouseButton.RIGHT`] Mouse button used to remove the most recently added point.

**mouse\_stop**

[`MouseButton` or None, default: `MouseButton.MIDDLE`] Mouse button used to stop input.

**Returns****list of tuples**

A list of the clicked (x, y) coordinates.

**Notes**

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

**Examples using `matplotlib.pyplot.ginput`**

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

**matplotlib.pyplot.gray**

`matplotlib.pyplot.gray()`

Set the colormap to 'gray'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.gray`****matplotlib.pyplot.grid**

`matplotlib.pyplot.grid(b=None, which='major', axis='both', **kwargs)`

Configure the grid lines.

**Parameters****b**

[bool or None, optional] Whether to show the grid lines. If any `kwargs` are supplied, it is assumed you want the grid on and `b` will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

### which

[{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

### axis

[{'both', 'x', 'y'}, optional] The axis to apply the changes on.

### \*\*kwargs

[*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3), bool or float array
<i>alpha</i>	scalar or None

Table 208 – continued from previous page

Property	Description
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

## Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the `Line2D` objects comprising the grid. Therefore, to set grid zorder, use `set_axisbelow` or, for more control, call the `set_zorder` method of each axis.

## `matplotlib.pyplot.hexbin`

```
matplotlib.pyplot.hexbin(x, y, C=None, gridsize=100, bins=None, xscale='linear',
                         yscale='linear', extent=None, cmap=None, norm=None,
                         vmin=None, vmax=None, alpha=None, linewidths=None,
                         edgecolors='face', reduce_C_function=<function mean
                         at 0x7f27f8437700>, mincnt=None, marginals=False, *,
                         data=None, **kwargs)
```

Make a 2D hexagonal binning plot of points `x`, `y`.

If  $C$  is *None*, the value of the hexagon is determined by the number of points in the hexagon. Otherwise,  $C$  specifies values at the coordinate  $(x[i], y[i])$ . For each hexagon, these values are reduced using *reduce\_C\_function*.

## Parameters

### x, y

[array-like] The data positions.  $x$  and  $y$  must be of the same length.

### C

[array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as  $x$  and  $y$ .

### gridsize

[int or (int, int), default: 100] If a single int, the number of hexagons in the  $x$ -direction. The number of hexagons in the  $y$ -direction is chosen such that the hexagons are approximately regular.

Alternatively, if a tuple  $(nx, ny)$ , the number of hexagons in the  $x$ -direction and the  $y$ -direction.

### bins

['log' or int or sequence, default: *None*] Discretization of the hexagon values.

- If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.
- If 'log', use a logarithmic scale for the colormap. Internally,  $\log_{10}(i + 1)$  is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.
- If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
- If a sequence of values, the values of the lower bound of the bins to be used.

### xscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

### yscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

### mincnt

[int > 0, default: *None*] If not *None*, only display cells with more than  $mincnt$  number of points in the cell.

### marginals

[bool, default: *False*] If *marginals* is *True*, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

**extent**

[float, default: *None*] The limits of the bins. The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

**Returns*****PolyCollection***

A *PolyCollection* defining the hexagonal bins.

- *PolyCollection.get\_offsets* contains a Mx2 array containing the x, y positions of the M hexagon centers.
- *PolyCollection.get\_array* contains the values of the M hexagons.

If *marginals* is *True*, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes *hbar* and *vbar*.

**Other Parameters****cmap**

[str or *Colormap*, default: `rcParams["image.cmap"]`] (default: 'viridis') The Colormap instance or registered colormap name used to map the bin values to colors.

**norm**

[*Normalize*, optional] The Normalize instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax**

[float, default: *None*] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of the bins in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

**alpha**

[float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewidths**

[float, default: *None*] If *None*, defaults to 1.0.

### edgecolors

[{'face', 'none', *None*} or color, default: 'face'] The color of the hexagon edges.  
Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- *None*: Draw outlines in the default color.
- An explicit color.

### reduce\_C\_function

[callable, default: `numpy.mean`] The function to aggregate *C* within the bins. It is ignored if *C* is not given. This must have the signature:

```
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpyamax`: value taken from the largest point

### \*\*kwargs

[*PolyCollection* properties] All other keyword arguments are passed on to *PolyCollection*:

Table 209 – continued from previous page

Property	Description
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', ':', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or dashes or linestyles or ls	str or tuple or list thereof
<code>linewidth</code> or linewidths or lw	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	(N, 2) or (2,) array-like
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `C`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.hexbin`

### `matplotlib.pyplot.hist`

```
matplotlib.pyplot.hist(x, bins=None, range=None, density=False, weights=None, cumulative=False, bottom=None, histtype='bar', align='mid', orientation='vertical', rwidth=None, log=False, color=None, label=None, stacked=False, *, data=None, **kwargs)
```

Plot a histogram.

Compute and draw the histogram of `x`. The return value is a tuple (`n, bins, patches`) or ([`n0, n1, ...`], `bins`, [`patches0, patches1, ...`]) if the input contains multiple data. See the documentation of the `weights` parameter to draw a histogram of already-binned data.

Multiple data can be provided via *x* as a list of datasets of potentially different length ( $[x_0, x_1, \dots]$ ), or as a 2D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported.

The *bins*, *range*, *weights*, and *density* parameters behave as in `numpy.histogram`.

### Parameters

#### x

[(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

#### bins

[int or sequence or str, default: `rcParams["hist.bins"]` (default: 10)] If *bins* is an integer, it defines the number of equal-width bins in the range.

If *bins* is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if *bins* is:

```
[1, 2, 3, 4]
```

then the first bin is [1, 2) (including 1, but excluding 2) and the second [2, 3). The last bin, however, is [3, 4], which *includes* 4.

If *bins* is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: 'auto', 'fd', 'doane', 'scott', 'stone', 'rice', 'sturges', or 'sqrt'.

#### range

[tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, *range* is  $(x.\min(), x.\max())$ . Range has no effect if *bins* is a sequence.

If *bins* is a sequence or *range* is specified, autoscaling is based on the specified bin range instead of the range of *x*.

#### density

[bool, default: False] If `True`, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts *and the bin width* ( $\text{density} = \text{counts} / (\text{sum(counts)} * \text{np.diff(bins)})$ ), so that the area under the histogram integrates to 1 ( $\text{np.sum(density} * \text{np.diff(bins)}) == 1$ ).

If *stacked* is also `True`, the sum of the histograms is normalized to 1.

#### weights

[(n,) array-like or None, default: None] An array of weights, of the same shape as *x*. Each value in *x* only contributes its associated weight towards the bin count

(instead of 1). If *density* is `True`, the weights are normalized, so that the integral of the density over the range remains 1.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `numpy.histogram` (by treating each bin as a single point with a weight equal to its count)

```
counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)
```

(or you may alternatively use `bar()`).

### cumulative

[bool or -1, default: `False`] If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If *density* is also `True` then the histogram is normalized such that the last bin equals 1.

If *cumulative* is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if *density* is also `True`, then the histogram is normalized such that the first bin equals 1.

### bottom

[array-like, scalar, or `None`, default: `None`] Location of the bottom of each bin, ie. bins are drawn from `bottom` to `bottom + hist(x, bins)`. If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of `bottom` must match the number of bins. If `None`, defaults to 0.

### histtype

[{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.
- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

### align

[{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.

- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.

- 'right': bars are centered on the right bin edges.

**orientation**

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', `barh` will be used for bar-type histograms and the `bottom` kwarg will be the left edges.

**rwidth**

[float or None, default: None] The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width.

Ignored if `histtype` is 'step' or 'stepfilled'.

**log**

[bool, default: False] If `True`, the histogram axis will be set to a log scale.

**color**

[color or array-like of colors or None, default: None] Color or sequence of colors, one per dataset. Default (`None`) uses the standard line color sequence.

**label**

[str or None, default: None] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that `legend` will work as expected.

**stacked**

[bool, default: False] If `True`, multiple data are stacked on top of each other. If `False` multiple data are arranged side by side if `histtype` is 'bar' or on top of each other if `histtype` is 'step'

**Returns****n**

[array or list of arrays] The values of the histogram bins. See `density` and `weights` for a description of the possible semantics. If input `x` is an array, then this is an array of length `nbins`. If input is a sequence of arrays [`data1`, `data2`, ...], then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The `dtype` of the array `n` (or of its element arrays) will always be float even if no weighting or normalization is used.

**bins**

[array] The edges of the bins. Length `nbins + 1` (`nbins` left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

**patches**

[`BarContainer` or list of a single `Polygon` or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

## Other Parameters

**\*\*kwargs**

*Patch* properties

See also:

[`hist2d`](#)

2D histograms

## Notes

For large numbers of bins (>1000), 'step' and 'stepfilled' can be significantly faster than 'bar' and 'barstacked'.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *weights*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

## Examples using `matplotlib.pyplot.hist`

- sphx\_glr\_gallery\_user\_interfaces\_svg\_histogram\_sgskip.py

## `matplotlib.pyplot.hist2d`

```
matplotlib.pyplot.hist2d(x, y, bins=10, range=None, density=False, weights=None,
                      cmin=None, cmax=None, *, data=None, **kwargs)
```

Make a 2D histogram plot.

### Parameters

**x, y**

[array-like, shape (n,)] Input values

**bins**

[None or int or [int, int] or array-like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions (*nx*=*ny*=*bins*).
- If [int, int], the number of bins in each dimension (*nx*, *ny* = *bins*).
- If array-like, the bin edges for the two dimensions (*x\_edges*=*y\_edges*=*bins*).

- If [array, array], the bin edges in each dimension (x\_edges, y\_edges = bins).

The default value is 10.

#### **range**

[array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): [[xmin, xmax], [ymin, ymax]]. All values outside of this range will be considered outliers and not tallied in the histogram.

#### **density**

[bool, default: False] Normalize histogram. See the documentation for the *density* parameter of [\*hist\*](#) for more details.

#### **weights**

[array-like, shape (n,), optional] An array of values w\_i weighing each sample (x\_i, y\_i).

#### **cmin, cmax**

[float, default: None] All bins that has count less than *cmin* or more than *cmax* will not be displayed (set to NaN before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return.

### **Returns**

#### **h**

[2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

#### **xedges**

[1D array] The bin edges along the x axis.

#### **yedges**

[1D array] The bin edges along the y axis.

#### **image**

[[\*QuadMesh\*](#)]

### **Other Parameters**

#### **cmap**

[Colormap or str, optional] A [\*colors.Colormap\*](#) instance. If not set, use rc settings.

**norm**

[Normalize, optional] A `colors.Normalize` instance is used to scale luminance data to [0, 1]. If not set, defaults to `colors.Normalize()`.

**vmin/vmax**

[None or scalar, optional] Arguments passed to the `Normalize` instance.

**alpha**

[0 <= scalar <= 1 or None, optional] The alpha blending value.

**\*\*kwargs**

Additional parameters are passed along to the `pcolormesh` method and `QuadMesh` constructor.

**See also:****`hist`**

1D histogram plotting

**Notes**

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a `colors.LogNorm` instance to the `norm` keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with `colors.PowerNorm`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `weights`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

**Examples using `matplotlib.pyplot.hist2d`****`matplotlib.pyplot.hlines`**

```
matplotlib.pyplot.hlines(y, xmin, xmax, colors=None, linestyles='solid', label='', *,
                         data=None, **kwargs)
```

Plot horizontal lines at each `y` from `xmin` to `xmax`.

**Parameters**

**y**

[float or array-like] y-indexes where to plot the lines.

**xmin, xmax**

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

**colors**

[list of colors, default: `rcParams["lines.color"]` (default: 'C0')]

**linestyles**

[{'solid', 'dashed', 'dashdot', 'dotted'}, optional]

**label**

[str, default: ""]

**Returns**

*LineCollection*

**Other Parameters****\*\*kwargs**

[*LineCollection* properties.]

**See also:****vlines**

vertical lines

**axhline**

horizontal line across the Axes

**Notes**

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `y, xmin, xmax, colors`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.hlines`

### `matplotlib.pyplot.hot`

```
matplotlib.pyplot.hot()
```

Set the colormap to 'hot'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.hot`

### `matplotlib.pyplot.hsv`

```
matplotlib.pyplot.hsv()
```

Set the colormap to 'hsv'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.hsv`

### `matplotlib.pyplot.imread`

```
matplotlib.pyplot.imread(fname, format=None)
```

Read an image from a file into an array.

#### Parameters

##### `fname`

[str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

Passing a URL is deprecated. Please open the URL for reading and pass the result to Pillow, e.g. with `PIL.Image.open(urllib.request.urlopen(url))`.

##### `format`

[str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

#### Returns

##### `numpy.array`

The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

### Examples using `matplotlib.pyplot.imread`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_clip\_path.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_demo.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_demo\_annotation\_box.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_demo\_text\_path.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_mathtext\_asarray.py
- sphx\_glr\_gallery\_misc\_demo\_ribbon\_box.py

### `matplotlib.pyplot.imsave`

`matplotlib.pyplot.imsave(fname, arr, **kwargs)`

Save an array as an image file.

#### Parameters

##### **fname**

[str or path-like or file-like] A path or a file-like object to store the image in. If *format* is not set, then the output format is inferred from the extension of *fname*, if any, and from `rcParams["savefig.format"]` (default: 'png') otherwise. If *format* is set, it determines the output format.

##### **arr**

[array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

##### **vmin, vmax**

[float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

##### **cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

##### **format**

[str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

### origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: 'upper')] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes.

### dpi

[float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

### metadata

[dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

### pil\_kwarg

[dict, optional] Keyword arguments passed to `PIL.Image.Image.save`. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

## Examples using `matplotlib.pyplot.imsave`

### `matplotlib.pyplot.imshow`

```
matplotlib.pyplot.imshow(X, cmap=None, norm=None, aspect=None, interpolation=None, alpha=None, vmin=None, vmax=None, origin=None, extent=None, *, filternorm=True, filterrad=4.0, resample=None, url=None, data=None, **kwargs)
```

Display data as an image, i.e., on a 2D regular raster.

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image set up the colormapping using the parameters `cmap='gray'`, `vmin=0`, `vmax=255`.

The number of pixels used to render an image is set by the Axes size and the *dpi* of the figure. This can lead to aliasing artifacts when the image is resampled because the displayed image size will usually not match the size of *X* (see /gallery/images\_contours\_and\_fields/image\_antialiasing). The resampling can be controlled via the *interpolation* parameter and/or `rcParams["image.interpolation"]` (default: 'antialiased').

### Parameters

#### X

[array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

#### cmap

[str or *Colormap*, default: `rcParams["image.cmap"]`] (default: 'viridis') The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data.

#### norm

[*Normalize*, optional] The *Normalize* instance used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

#### aspect

[{'equal', 'auto'} or float, default: `rcParams["image.aspect"]`] (default: 'equal') The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using *extent*).
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.

#### interpolation

[str, default: `rcParams["image.interpolation"]`] (default: 'antialiased') The interpolation method used.

Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'.

If *interpolation* is 'none', then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to 'nearest'. Note that most SVG renderers perform interpolation at rendering and that the default interpolation method they implement may differ.

If *interpolation* is the default 'antialiased', then 'nearest' interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller

than 3, or the image is downsampled, then 'hanning' interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See [/gallery/images\\_contours\\_and\\_fields/interpolation\\_methods](/gallery/images_contours_and_fields/interpolation_methods) for an overview of the supported interpolation methods, and [/gallery/images\\_contours\\_and\\_fields/image\\_antialiasing](/gallery/images_contours_and_fields/image_antialiasing) for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

### alpha

[float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

### vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is deprecated to use *vmin/vmax* when *norm* is given. When using RGB(A) data, parameters *vmin/vmax* are ignored.

### origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axis points upward for 'lower' but downward for 'upper'.

See the [origin and extent in imshow](#) tutorial for examples and a more detailed description.

### extent

[floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For *origin == 'upper'* the default is (-0.5, numcols-0.5, numrows-0.5, -0.5).
- For *origin == 'lower'* the default is (-0.5, numcols-0.5, -0.5, numrows-0.5).

See the [origin and extent in imshow](#) tutorial for examples and a more detailed description.

**filternorm**

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad**

[float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

**resample**

[bool, default: `rcParams["image.resample"]` (default: True)] When *True*, use a full resampling method. When *False*, only resample when the output image is larger than the input image.

**url**

[str, optional] Set the url of the created `AxesImage`. See `Artist.set_url`.

**Returns**

`AxesImage`

**Other Parameters****\*\*kwargs**

[`Artist` properties] These parameters are passed on to the constructor of the `AxesImage` artist.

**See also:****`matshow`**

Plot a matrix or an array as an image.

## Notes

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

`imshow` expects RGB images adopting the straight (unassociated) alpha representation.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.imshow`

- sphx\_glr\_gallery\_misc\_hyperlinks\_sgskip.py

## `matplotlib.pyplot.inferno`

`matplotlib.pyplot.inferno()`

Set the colormap to 'inferno'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.inferno`

## `matplotlib.pyplot.install_repl_displayhook`

`matplotlib.pyplot.install_repl_displayhook()`

Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.

This works both with IPython and with vanilla python shells.

### Examples using `matplotlib.pyplot.install_repl_displayhook`

#### `matplotlib.pyplot.ioff`

```
matplotlib.pyplot.ioff()
```

Disable interactive mode.

See `pyplot.isinteractive` for more details.

**See also:**

`ion`

Enable interactive mode.

`isinteractive`

Whether interactive mode is enabled.

`show`

Show all figures (and maybe block).

`pause`

Show all figures, and block for a time.

#### Notes

For a temporary change, this can be used as a context manager:

```
# if interactive mode is on
# then figures will be shown on creation
plt.ion()
# This figure will be shown immediately
fig = plt.figure()

with plt.ioff():
    # interactive mode will be off
    # figures will not automatically be shown
    fig2 = plt.figure()
    # ...
```

To enable usage as a context manager, this function returns an `_IoffContext` object. The return value is not intended to be stored or accessed by the user.

## Examples using `matplotlib.pyplot.ioff`

- *Usage Guide*

### `matplotlib.pyplot.ion`

`matplotlib.pyplot.ion()`

Enable interactive mode.

See `pyplot.isinteractive` for more details.

**See also:**

`ioff`

Disable interactive mode.

`isinteractive`

Whether interactive mode is enabled.

`show`

Show all figures (and maybe block).

`pause`

Show all figures, and block for a time.

### Notes

For a temporary change, this can be used as a context manager:

```
# if interactive mode is off
# then figures will not be shown on creation
plt.ioff()
# This figure will not be shown immediately
fig = plt.figure()

with plt.ion():
    # interactive mode will be on
    # figures will automatically be shown
    fig2 = plt.figure()
    # ...
```

To enable usage as a context manager, this function returns an `_IonContext` object. The return value is not intended to be stored or accessed by the user.

### Examples using `matplotlib.pyplot.ion`

- *Usage Guide*

#### `matplotlib.pyplot.isinteractive`

`matplotlib.pyplot.isinteractive()`

Return whether plots are updated after every plotting command.

The interactive mode is mainly useful if you build plots from the command line and want to see the effect of each command while you are building the figure.

In interactive mode:

- newly created figures will be shown immediately;
- figures will automatically redraw on change;
- `pyplot.show` will not block by default.

In non-interactive mode:

- newly created figures and changes to figures will not be reflected until explicitly asked to be;
- `pyplot.show` will block by default.

**See also:**

`ion`

Enable interactive mode.

`ioff`

Disable interactive mode.

`show`

Show all figures (and maybe block).

`pause`

Show all figures, and block for a time.

### Examples using `matplotlib.pyplot.isinteractive`

#### `matplotlib.pyplot.jet`

`matplotlib.pyplot.jet()`

Set the colormap to 'jet'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.jet`

### `matplotlib.pyplot.legend`

`matplotlib.pyplot.legend(*args, **kwargs)`

Place a legend on the Axes.

Call signatures:

```
legend()
legend(labels)
legend(handles, labels)
```

The call signatures correspond to these three different ways to use this method:

#### 1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Axes.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

#### 2. Labeling existing plot elements

To make a legend for lines which already exist on the Axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

#### 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
ax.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

## Parameters

### handles

[sequence of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

### labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

## Returns

### *Legend*

## Other Parameters

### loc

[str or pair of floats, default: `rcParams["legend.loc"]`] (default: 'best') ('best' for axes, 'upper right' for figures) The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor**

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox\_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (*x*, *y*, *width*, *height*) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (*x*, *y*) places the corner of the legend specified by *loc* at *x*, *y*. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol**

[int, default: 1] The number of columns that the legend has.

**prop**

[None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font

size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

**labelcolor**

[str or list] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints**

[int, default: `rcParams["legend.numpoints"]`] (default: 1) The number of marker points in the legend when creating a legend entry for a `Line2D` (line).

**scatterpoints**

[int, default: `rcParams["legend.scatterpoints"]`] (default: 1) The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot).

**scatteryoffsets**

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale**

[float, default: `rcParams["legend.markerscale"]`] (default: 1.0) The relative size of legend markers compared with the originally drawn ones.

**markerfirst**

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

**frameon**

[bool, default: `rcParams["legend.frameon"]`] (default: True) Whether the legend should be drawn on a patch (frame).

**fancybox**

[bool, default: `rcParams["legend.fancybox"]`] (default: True) Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.

**shadow**

[bool, default: `rcParams["legend.shadow"]`] (default: False) Whether to draw a shadow behind the legend.

**framealpha**

[float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If `shadow` is activated and `framealpha` is `None`, the default value is ignored.

#### facecolor

[`"inherit"` or color, default: `rcParams["legend.facecolor"]` (default: '`inherit`')] The legend's background color. If `"inherit"`, use `rcParams["axes.facecolor"]` (default: '`white`').

#### edgecolor

[`"inherit"` or color, default: `rcParams["legend.edgecolor"]` (default: '`0.8`')] The legend's background patch edge color. If `"inherit"`, use take `rcParams["axes.edgecolor"]` (default: '`black`').

#### mode

[`{"expand", None}`] If `mode` is set to `"expand"` the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend's size).

#### bbox\_transform

[`None` or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.

#### title

[str or `None`] The legend's title. Default is no title (`None`).

#### title\_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: `None`)] The font size of the legend's title.

#### borderpad

[float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

#### labelspacing

[float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.

#### handlelength

[float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.

#### handletextpad

[float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.

### **borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)]  
The pad between the axes and legend border, in font-size units.

### **columnspacing**

[float, default: `rcParams["legend.columnspacing"]` (default: 2.0)]  
The spacing between columns, in font-size units.

### **handler\_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

**See also:**

`Figure.legend`

### **Notes**

Some artists are not supported by this function. See `Legend guide` for details.

## **Examples**

### **Examples using `matplotlib.pyplot.legend`**

- sphx\_glr\_gallery\_user\_interfaces\_svg\_histogram\_sgskip.py

## **`matplotlib.pyplot.locator_params`**

`matplotlib.pyplot.locator_params` (`axis='both'`, `tight=None`, `**kwargs`)

Control behavior of major tick locators.

Because the locator is involved in autoscaling, `autoscale_view` is called automatically after the parameters are changed.

### **Parameters**

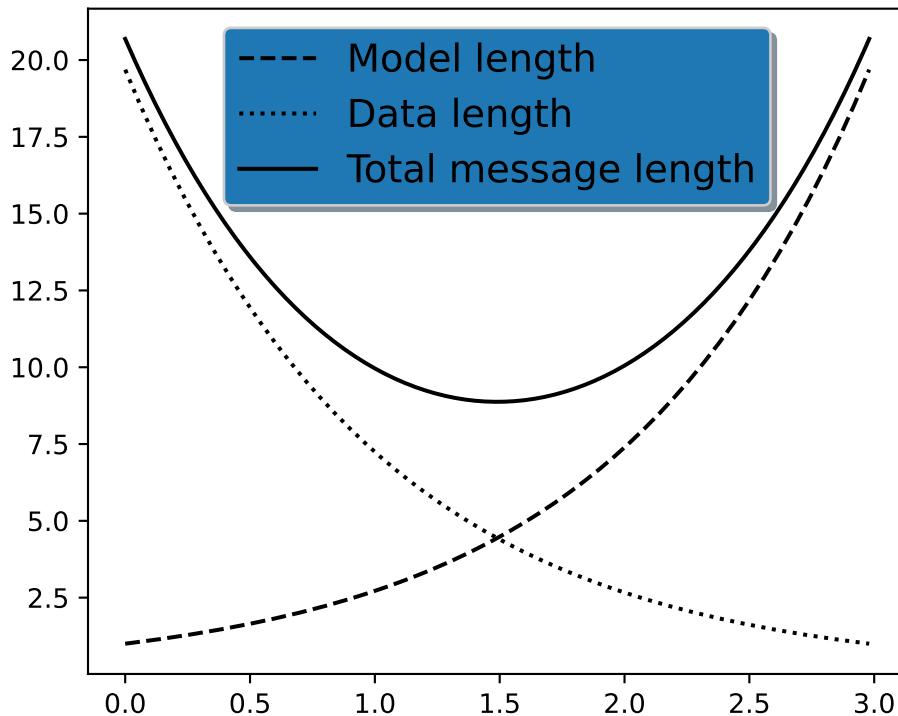

#### **axis**

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate.

#### **tight**

[bool or None, optional] Parameter passed to `autoscale_view`. Default is None, for no change.

### **Other Parameters**

### \*\*kwargs

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example `set_params` for the `ticker.MaxNLocator` used by default for linear axes.

## Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

### Examples using `matplotlib.pyplot.locator_params`

#### `matplotlib.pyplot.loglog`

`matplotlib.pyplot.loglog(*args, **kwargs)`

Make a plot with log scaling on both the x and y axis.

Call signatures:

```
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `base`, `subs` and `nonpositive` control the x/y-axis properties. They are just forwarded to `Axes.set_xscale` and `Axes.set_yscale`. To use different properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

#### Parameters

##### `base`

[float, default: 10] Base of the logarithm.

##### `subs`

[sequence, optional] The location of the minor ticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale/Axes.set_yscale` for details.

##### `nonpositive`

[{'mask', 'clip'}, default: 'mask'] Non-positive values can be masked as invalid, or clipped to a very small positive number.

#### Returns

##### `list of Line2D`

Objects representing the plotted data.

#### Other Parameters

##### `**kwargs`

All parameters supported by `plot`.

## Examples using `matplotlib.pyplot.loglog`

- *Sample plots in Matplotlib*

### `matplotlib.pyplot.magma`

`matplotlib.pyplot.magma()`

Set the colormap to 'magma'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.magma`

### `matplotlib.pyplot.magnitude_spectrum`

`matplotlib.pyplot.magnitude_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, *, data=None, **kwargs)`

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

#### Parameters

##### **x**

[1-D array or sequence] Array or sequence containing the data.

##### **Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

##### **window**

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

##### **sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

**scale**

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale, i.e., the dB amplitude ( $20 * \log_{10}$ ). 'default' is 'linear'.

**Fc**

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns****spectrum**

[1-D array] The values for the magnitude spectrum before scaling (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**line**

[*Line2D*] The line created by this function.

**Other Parameters****\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	scalar or <code>None</code>
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or <code>None</code>
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown

<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

**See also:****`psd`**

Plots the power spectral density.

**`angle_spectrum`**

Plots the angles of the corresponding frequencies.

**`phase_spectrum`**

Plots the phase (unwrapped angle) of the corresponding frequencies.

***specgram***

Can plot the magnitude spectrum of segments within the signal in a colormap.

**Notes**

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

**Examples using `matplotlib.pyplot.magnitude_spectrum`****`matplotlib.pyplot.margins`**

`matplotlib.pyplot.margins (*margins, x=None, y=None, tight=True)`

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the *margin* times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a `TypeError`. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not *None*, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

**Parameters****\*margins**

[float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

**x, y**

[float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

**tight**

[bool or None, default: True] The *tight* parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Set *tight* to *None* will preserve the previous setting.

**Returns****xmargin, ymargin**

[float]

**Notes**

If a previously used Axes method such as `pcolor()` has set `use_sticky_edges` to `True`, only the limits not set by the "sticky artists" will be modified. To force all of the margins to be set, set `use_sticky_edges` to `False` before calling `margins()`.

**Examples using `matplotlib.pyplot.margins`**

- sphx\_glr\_gallery\_ticks\_and\_spines\_ticklabels\_rotation.py

**`matplotlib.pyplot.matshow`**

`matplotlib.pyplot.matshow(A, fignum=None, **kwargs)`

Display an array as a matrix in a new figure window.

The origin is set at the upper left hand corner and rows (first dimension of the array) are displayed horizontally. The aspect ratio of the figure window is that of the array, unless this would make an excessively short or narrow figure.

Tick labels for the xaxis are placed on top.

**Parameters****A**

[2D array-like] The matrix to be displayed.

**fignum**

[None or int or False] If `None`, create a new figure window with automatic numbering.

If a nonzero integer, draw into the figure with the given number (create it if it does not exist).

If 0, use the current axes (or create one if it does not exist).

---

**Note:** Because of how `Axes.matshow` tries to set the figure aspect ratio to be the one of the array, strange things may happen if you reuse an existing figure.

---

**Returns**

### `AxesImage`

#### Other Parameters

##### `**kwargs`

[`imshow` arguments]

### Examples using `matplotlib.pyplot.matshow`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_matshow.py

### `matplotlib.pyplot.minorticks_off`

`matplotlib.pyplot.minorticks_off()`

Remove minor ticks from the axes.

### Examples using `matplotlib.pyplot.minorticks_off`

### `matplotlib.pyplot.minorticks_on`

`matplotlib.pyplot.minorticks_on()`

Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using `minorticks_off()` if drawing speed is a problem.

### Examples using `matplotlib.pyplot.minorticks_on`

### `matplotlib.pyplot.new_figure_manager`

`matplotlib.pyplot.new_figure_manager(num, *args, **kwargs)`

Create a new figure manager instance.

### Examples using `matplotlib.pyplot.new_figure_manager`

### `matplotlib.pyplot.nipy_spectral`

`matplotlib.pyplot.nipy_spectral()`

Set the colormap to 'nipy\_spectral'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.nipy_spectral`

### `matplotlib.pyplot.pause`

`matplotlib.pyplot.pause(interval)`

Run the GUI event loop for *interval* seconds.

If there is an active figure, it will be updated and displayed before the pause, and the GUI event loop (if any) will run during the pause.

This can be used for crude animation. For more complex animation use `matplotlib.animation`.

If there is no active figure, sleep for *interval* seconds instead.

**See also:**

`matplotlib.animation`

Proper animations

`show`

Show all figures and optional block until all figures are closed.

## Examples using `matplotlib.pyplot.pause`

- sphx\_glr\_gallery\_mplot3d\_rotate\_axes3d\_sgskip.py
- sphx\_glr\_gallery\_mplot3d\_wire3d\_animation\_sgskip.py

### `matplotlib.pyplot.pcolor`

`matplotlib.pyplot.pcolor(*args, shading=None, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)`

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y,] C, **kwargs)
```

*X* and *Y* can be used to specify the corners of the quadrilaterals.

---

**Hint:** `pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster `pcolormesh` instead. See [Differences between pcolor\(\) and pcolormesh\(\)](#) for a discussion of the differences.

---

### Parameters

**C**

[2D array-like] The color-mapped values.

**X, Y**

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

$(X[i+1, j], Y[i+1, j])$	$(X[i+1, j+1], Y[i+1, j+1])$
+-----+	+-----+
+-----+	
$(X[i, j], Y[i, j])$	$(X[i, j+1], Y[i, j+1])$

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the [Notes](#) section below.

If `shading='flat'` the dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ , and the quadrilateral is colored due to the value at  $C[i, j]$ . If  $X$ ,  $Y$  and  $C$  have equal dimensions, a warning will be raised and the last row and column of  $C$  will be ignored.

If `shading='nearest'`, the dimensions of  $X$  and  $Y$  should be the same as those of  $C$  (if not, a `ValueError` will be raised). The color  $C[i, j]$  will be centered on  $(X[i, j], Y[i, j])$ .

If  $X$  and/or  $Y$  are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

**shading**

[{'flat', 'nearest', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad  $(i, j)$ ,  $(i+1, j)$ ,  $(i, j+1)$ ,  $(i+1, j+1)$  is given by  $C[i, j]$ . The dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ ; if they are the same as  $C$ , then a deprecation warning is raised, and the last row and column of  $C$  are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of  $X$  and  $Y$  must be the same as  $C$ .
- 'auto': Choose 'flat' if dimensions of  $X$  and  $Y$  are one larger than  $C$ . Choose 'nearest' if dimensions are the same.

See `/gallery/images_contours_and_fields/pcolormesh_grids` for more description.

**cmap**

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps the  $C$  values to colors.

**norm**

[*Normalize*, optional] The *Normalize* instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

### vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

### edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or ': No edge.
- *None*: `rcParams["patch.edgecolor"]` (default: 'black') will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: False) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

### alpha

[float, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The *edgecolor* is currently not affected by this.

### snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

## Returns

`matplotlib.collections.Collection`

## Other Parameters

### antialiaseds

[bool, default: False] The default *antialiaseds* is False if the default *edgecolors*="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of *alpha*. If *edgecolors* is not "none", then the default *antialiaseds* is taken from `rcParams["patch.antialiased"]` (default: True). Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

### \*\*kwargs

Additionally, the following arguments are allowed. They are passed along to the *PolyCollection* constructor:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	array-like or scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray or None
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clim</code>	(vmin: float, vmax: float)

`pcolormesh`

for an explanation of the differences between `pcolor` and `pcolormesh`.

`imshow`

---

If  $X$  and  $Y$  are each equidistant, `imshow` can be a faster alternative.

## Notes

### Masked arrays

$X$ ,  $Y$  and  $C$  may be masked arrays. If either  $C[i, j]$ , or one of the vertices surrounding  $C[i, j]$  ( $X$  or  $Y$  at  $[i, j]$ ,  $[i+1, j]$ ,  $[i, j+1]$ ,  $[i+1, j+1]$ ) is masked, nothing is plotted.

### Grid orientation

The grid orientation follows the standard matrix convention: An array  $C$  with shape (nrows, ncolumns) is plotted with the column number as  $X$  and the row number as  $Y$ .

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string  $s$ , which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.pcolor`

### `matplotlib.pyplot.pcolormesh`

```
matplotlib.pyplot.pcolormesh(*args, alpha=None, norm=None, cmap=None,
                             vmin=None, vmax=None, shading=None, anti-
                             aliased=False, data=None, **kwargs)
```

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolormesh([X, Y,] C, **kwargs)
```

$X$  and  $Y$  can be used to specify the corners of the quadrilaterals.

---

**Hint:** `pcolormesh` is similar to `pcolor`. It is much faster and preferred in most cases. For a detailed discussion on the differences see [Differences between pcolor\(\) and pcolormesh\(\)](#).

---

## Parameters

### C

[2D array-like] The color-mapped values.

### X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])      (X[i+1, j+1], Y[i+1, j+1])
+-----+
|           |
+-----+
(X[i, j], Y[i, j])      (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the [Notes](#) section below.

If `shading='flat'` the dimensions of `X` and `Y` should be one greater than those of `C`, and the quadrilateral is colored due to the value at `C[i, j]`. If `X`, `Y` and `C` have equal dimensions, a warning will be raised and the last row and column of `C` will be ignored.

If `shading='nearest'` or `'gouraud'`, the dimensions of `X` and `Y` should be the same as those of `C` (if not, a `ValueError` will be raised). For `'nearest'` the color `C[i, j]` is centered on `(X[i, j], Y[i, j])`. For `'gouraud'`, a smooth interpolation is carried out between the quadrilateral corners.

If `X` and/or `Y` are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

### cmap

[str or `Colormap`, default: `rcParams["image.cmap"]`] (default: `'viridis')`] A Colormap instance or registered colormap name. The colormap maps the `C` values to colors.

### norm

[`Normalize`, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

### vmin, vmax

[float, default: `None`] The colorbar range. If `None`, suitable min/max values are automatically chosen by the `Normalize` instance (defaults to the respective min/max values of `C` in case of the default linear scaling). It is deprecated to use `vmin/vmax` when `norm` is given.

### edgecolors

[{'none', `None`, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or `"`: No edge.
- `None`: `rcParams["patch.edgecolor"]` (default: `'black'`) will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: `False`) has to be True for this to work.

- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

### alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

### shading

[{'flat', 'nearest', 'gouraud', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad  $(i, j), (i+1, j), (i, j+1), (i+1, j+1)$  is given by  $C[i, j]$ . The dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ ; if they are the same as  $C$ , then a deprecation warning is raised, and the last row and column of  $C$  are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of  $X$  and  $Y$  must be the same as  $C$ .
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners  $(i, j)$  are given by  $C[i, j]$ . The color values of the area in between is interpolated from the corner values. The dimensions of  $X$  and  $Y$  must be the same as  $C$ . When Gouraud shading is used, *edgecolors* is ignored.
- 'auto': Choose 'flat' if dimensions of  $X$  and  $Y$  are one larger than  $C$ . Choose 'nearest' if dimensions are the same.

See `/gallery/images_contours_and_fields/pcolormesh_grids` for more description.

### snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

### rasterized: bool, optional

Rasterize the pcolormesh when drawing vector graphics. This can speed up rendering and produce smaller files for large data sets. See also `/gallery/misc/rasterization_demo`.

## Returns

`matplotlib.collections.QuadMesh`

## Other Parameters

### \*\*kwargs

Additionally, the following arguments are allowed. They are passed along to the `QuadMesh` constructor:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a dpi value, and returns
<code>alpha</code>	array-like or scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray or None
<code>capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>clim</code>	(vmin: float, vmax: float)
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>cmap</code>	<code>Colormap</code> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<code>Figure</code>
<code>gid</code>	str
<code>hatch</code>	{'/', '\\", ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	(N, 2) or (2,) array-like
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

See also:

`pcolor`

An alternative implementation with slightly different features. For a detailed discussion on the differences see [Differences between `pcolor\(\)` and `pcolormesh\(\)`](#).

### `imshow`

If  $X$  and  $Y$  are each equidistant, `imshow` can be a faster alternative.

## Notes

### Masked arrays

$C$  may be a masked array. If  $C[i, j]$  is masked, the corresponding quadrilateral will be transparent. Masking of  $X$  and  $Y$  is not supported. Use `pcolor` if you need this functionality.

### Grid orientation

The grid orientation follows the standard matrix convention: An array  $C$  with shape (nrows, ncolumns) is plotted with the column number as  $X$  and the row number as  $Y$ .

### Differences between `pcolor()` and `pcolormesh()`

Both methods are used to create a pseudocolor plot of a 2D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While `pcolor` returns a `PolyCollection`, `pcolormesh` returns a `QuadMesh`. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both `pcolor` and `pcolormesh` support masked arrays for  $C$ . However, only `pcolor` supports masked arrays for  $X$  and  $Y$ . The reason lies in the internal handling of the masked values. `pcolor` leaves out the respective polygons from the PolyCollection. `pcolormesh` sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in `pcolor` is not drawn as the corresponding polygons do not exist in the PolyCollection.

Another difference is the support of Gouraud shading in `pcolormesh`, which is not available with `pcolor`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string  $s$ , which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.pcolormesh`

- *Sample plots in Matplotlib*

**matplotlib.pyplot.phase\_spectrum**

```
matplotlib.pyplot.phase_spectrum(x,      Fs=None,      Fc=None,      window=None,
                                  pad_to=None,    sides=None,     *,      data=None,
                                  **kwargs)
```

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

**Parameters****x**

[1-D array or sequence] Array or sequence containing the data

**Fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

**Fc**

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns****spectrum**

[1-D array] The values for the phase spectrum in radians (real valued).

### **freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

### **line**

[*Line2D*] The line created by this function.

## Other Parameters

### **\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or c	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>dash_joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or ls	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<i>linewidth</i> or lw	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgecolor</i> or mec	color
<i>markeredgewidth</i> or mew	float
<i>markerfacecolor</i> or mfc	color
<i>markerfacecoloralt</i> or mfcalt	color
<i>markersize</i> or ms	float
<i>markevery</i>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	float or callable[[Artist, Event], tuple[bool, dict]]
<i>pickradius</i>	float

continues on

Table 213 – continued from previous page

Property	Description
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

See also:

**`magnitude_spectrum`**

Plots the magnitudes of the corresponding frequencies.

**`angle_spectrum`**

Plots the wrapped version of this function.

**`specgram`**

Can plot the phase spectrum of segments within the signal in a colormap.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.phase_spectrum`

### `matplotlib.pyplot.pie`

```
matplotlib.pyplot.pie(x, explode=None, labels=None, colors=None, autopct=None, pct-
distance=0.6, shadow=False, labeldistance=1.1, startangle=0, ra-
dius=1, counterclock=True, wedgeprops=None, textprops=None,
center=0, 0, frame=False, rotatelabels=False, *, normalize=None,
data=None)
```

Plot a pie chart.

Make a pie chart of array  $x$ . The fractional area of each wedge is given by  $x/\text{sum}(x)$ . If  $\text{sum}(x) < 1$ , then the values of  $x$  give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size  $1 - \text{sum}(x)$ .

The wedges are plotted counterclockwise, by default starting from the x-axis.

## Parameters

### **x**

[1D array-like] The wedge sizes.

### **explode**

[array-like, default: None] If not *None*, is a  $\text{len}(x)$  array which specifies the fraction of the radius with which to offset each wedge.

### **labels**

[list, default: None] A sequence of strings providing the labels for each wedge

### **colors**

[array-like, default: None] A sequence of colors through which the pie chart will cycle. If *None*, will use the colors in the currently active cycle.

### **autopct**

[None or str or callable, default: None] If not *None*, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be  $\text{fmt} \% \text{ pct}$ . If it is a function, it will be called.

### **pctdistance**

[float, default: 0.6] The ratio between the center of each pie slice and the start of the text generated by *autopct*. Ignored if *autopct* is *None*.

### **shadow**

[bool, default: False] Draw a shadow beneath the pie.

### **normalize**

[None or bool, default: None] When *True*, always make a full pie by normalizing  $x$  so that  $\text{sum}(x) == 1$ . *False* makes a partial pie if  $\text{sum}(x) <= 1$  and raises a `ValueError` for  $\text{sum}(x) > 1$ .

When *None*, defaults to *True* if  $\text{sum}(x) >= 1$  and *False* if  $\text{sum}(x) < 1$ .

Please note that the previous default value of *None* is now deprecated, and the default will change to *True* in the next release. Please pass `normalize=False` explicitly if you want to draw a partial pie.

### **labeldistance**

[float or None, default: 1.1] The radial distance at which the pie labels are drawn. If set to *None*, label are not drawn, but are stored for use in `legend()`

**startangle**

[float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.

**radius**

[float, default: 1] The radius of the pie.

**counterclock**

[bool, default: True] Specify fractions direction, clockwise or counterclockwise.

**wedgeprops**

[dict, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in `wedgeprops = {'linewidth': 3}` to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default `clip_on=False`.

**textprops**

[dict, default: None] Dict of arguments to pass to the text objects.

**center**

[(float, float), default: (0, 0)] The coordinates of the center of the chart.

**frame**

[bool, default: False] Plot Axes frame with the chart if true.

**rotatelabels**

[bool, default: False] Rotate each label to the angle of the corresponding slice if true.

**Returns****patches**

[list] A sequence of `matplotlib.patches.Wedge` instances

**texts**

[list] A list of the label `Text` instances.

**autotexts**

[list] A list of `Text` instances for the numeric labels. This will only be returned if the parameter `autopct` is not `None`.

## Notes

The pie chart will probably look best if the figure and Axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The Axes aspect ratio can be controlled with `Axes.set_aspect`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `explode`, `labels`, `colors`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.pie`

- *Sample plots in Matplotlib*

### `matplotlib.pyplot.pink`

`matplotlib.pyplot.pink()`

Set the colormap to 'pink'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.pink`

### `matplotlib.pyplot.plasma`

`matplotlib.pyplot.plasma()`

Set the colormap to 'plasma'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.plasma`

### `matplotlib.pyplot.plot`

`matplotlib.pyplot.plot(*args, scalex=True, scaley=True, data=None, **kwargs)`

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by *x*, *y*.

The optional parameter *fmt* is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the *Notes* section below.

```
>>> plot(x, y)           # plot x and y using default line style and color
>>> plot(x, y, 'bo')    # plot x and y using blue circle markers
>>> plot(y)             # plot y using x as index array 0..N-1
>>> plot(y, 'r+')       # ditto, but with red plusses
```

You can use *Line2D* properties as keyword arguments for more control on the appearance. Line properties and *fmt* can be mixed. The following two calls yield identical results:

```
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
...        linewidth=2, markersize=12)
```

When conflicting with *fmt*, keyword arguments take precedence.

### Plotting labelled data

There's a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index *obj* ['y']). Instead of giving the data in *x* and *y*, you can provide the object in the *data* parameter and just give the labels for *x* and *y*:

```
>>> plot(' xlabel', ' ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a *dict*, a *pandas.DataFrame* or a structured numpy array.

### Plotting multiple sets of data

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call *plot* multiple times. Example:

```
>>> plot(x1, y1, 'bo')
>>> plot(x2, y2, 'go')
```

- If *x* and/or *y* are 2D arrays a separate data set will be drawn for every column. If both *x* and *y* are 2D, they must have the same shape. If only one of them is 2D with shape (N, m) the other must have length N and will be used for every data set m.

Example:

```
>>> x = [1, 2, 3]
>>> y = np.array([[1, 2], [3, 4], [5, 6]])
>>> plot(x, y)
```

is equivalent to:

```
>>> for col in range(y.shape[1]):
...     plot(x, y[:, col])
```

- The third way is to specify multiple sets of  $[x], y, [fmt]$  groups:

```
>>> plot(x1, y1, 'g^', x2, y2, 'g-')
```

In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the *data* parameter.

By default, each line is assigned a different style specified by a 'style cycle'. The *fmt* and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

## Parameters

### x, y

[array-like or scalar] The horizontal / vertical coordinates of the data points. *x* values are optional and default to `range(len(y))`.

Commonly, these parameters are 1D arrays.

They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

These arguments cannot be passed as keywords.

### fmt

[str, optional] A format string, e.g. 'ro' for red circles. See the *Notes* section for a full description of the format strings.

Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

### data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

---

**Note:** Technically there's a slight ambiguity in calls where the second label is a valid *fmt*. `plot('n', 'o', data=obj)` could be `plt(x, y)` or `plt(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

---

## Returns

### list of *Line2D*

A list of lines representing the plotted data.

### Other Parameters

#### **scalex, scaley**

[bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to `autoscale_view`.

#### **\*\*kwargs**

[*Line2D* properties, optional] `kwargs` are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1',  
      linewidth=2)  
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you specify multiple lines with one plot call, the `kwargs` apply to all those lines. In case the `label` object is iterable, each element is used as labels for each set of data.

Here is a list of available *Line2D* properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<i>Figure</i>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <i>Path</i> or <i>MarkerStyle</i>

Property	Description
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

See also:

### `scatter`

XY scatter plot with markers of varying size and/or color ( sometimes also called bubble chart).

## Notes

### Format Strings

A format string consists of a part for color, marker and line:

```
fmt = '[marker][line][color]'
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If `line` is given, but no `marker`, the data will be a line without markers.

Other combinations such as `[color][marker][line]` are also supported, but note that their parsing may be ambiguous.

### Markers

character	description
'.'	point marker
', '	pixel marker
'o'	circle marker
'v'	triangle_down marker
'^'	triangle_up marker
'<'	triangle_left marker
'>'	triangle_right marker
'1'	tri_down marker
'2'	tri_up marker
'3'	tri_left marker
'4'	tri_right marker
'8'	octagon marker
's'	square marker
'p'	pentagon marker
'P'	plus (filled) marker
'*'	star marker
'h'	hexagon1 marker
'H'	hexagon2 marker
'+'	plus marker
'x'	x marker
'X'	x (filled) marker
'D'	diamond marker
'd'	thin_diamond marker
' '	vline marker
'_'	hline marker

## Line Styles

character	description
' - '	solid line style
' -- '	dashed line style
' - . '	dash-dot line style
' : '	dotted line style

Example format strings:

```
'b'      # blue markers with default shape
'or'     # red circles
'-g'     # green solid line
'--'     # dashed line with default color
'^k:'   # black triangle_up markers connected by a dotted line
```

## Colors

The supported color abbreviations are the single letter codes

character	color
'b'	blue
'g'	green
'r'	red
'c'	cyan
'm'	magenta
'y'	yellow
'k'	black
'w'	white

and the 'CN' colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any `matplotlib.colors` spec, e.g. full names ('green') or hex strings ('#008000').

## Examples using `matplotlib.pyplot.plot`

- *Frame grabbing*
- `sphx_glr_gallery_misc_print_stdout_sgskip.py`
- `sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py`

## `matplotlib.pyplot.plot_date`

```
matplotlib.pyplot.plot_date(x, y, fmt='o', tz=None, xdate=True, ydate=False, *,  
                           data=None, **kwargs)
```

Plot coercing the axis to treat floats as dates.

Similar to `plot`, this plots `y` vs. `x` as lines or markers. However, the axis labels are formatted as dates depending on `xdate` and `ydate`. Note that `plot` will work with `datetime` and `numpy.datetime64` objects without resorting to this method.

### Parameters

#### `x, y`

[array-like] The coordinates of the data points. If `xdate` or `ydate` is `True`, the respective values `x` or `y` are interpreted as *Matplotlib dates*.

#### `fmt`

[str, optional] The plot format string. For details, see the corresponding parameter in `plot`.

#### `tz`

[timezone string or `datetime.tzinfo`, default: `rcParams["timezone"]`] (default: 'UTC') The time zone to use in labeling dates.

**xdate**

[bool, default: True] If *True*, the *x*-axis will be interpreted as Matplotlib dates.

**ydate**

[bool, default: False] If *True*, the *y*-axis will be interpreted as Matplotlib dates.

**Returns****list of *Line2D***

Objects representing the plotted data.

**Other Parameters****\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3), bool or None
<i>alpha</i>	scalar or None
<i>animated</i>	bool
<i>antialiased</i> or aa	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or c	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<i>dash_joinstyle</i>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or ls	{'-', '--', '-.', ':', (offset, on-off-seq), ...}
<i>linewidth</i> or lw	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgecolor</i> or mec	color
<i>markeredgewidth</i> or mew	float
<i>markerfacecolor</i> or mfc	color
<i>markerfacecoloralt</i> or mfcalt	color
<i>markersize</i> or ms	float

continues on the next page

Table 215 – continued from previous page

Property	Description
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}

<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

**See also:****`matplotlib.dates`**

Helper functions on dates.

**`matplotlib.dates.date2num`**

Convert dates to num.

**`matplotlib.dates.num2date`**

Convert num to dates.

**`matplotlib.dates.drange`**

Create an equally spaced sequence of dates.

**Notes**

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to `plot_date`. `plot_date` will set the default tick locator to `AutoDateLocator` (if the tick locator is not already set to a `DateLocator` instance) and the default tick formatter to `AutoDateFormatter` (if the tick formatter is not already set to a `DateFormatter` instance).

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.plot_date`

- sphx\_glr\_gallery\_ticks\_and\_spines\_date\_demo\_rrule.py

## matplotlib.pyplot.polar

```
matplotlib.pyplot.polar(*args, **kwargs)
```

Make a polar plot.

call signature:

```
polar(theta, r, **kwargs)
```

Multiple *theta*, *r* arguments are supported, with format strings, as in [\*plot\*](#).

## Examples using `matplotlib.pyplot.polar`

- sphx\_glr\_gallery\_misc\_transoffset.py
- *Sample plots in Matplotlib*

## matplotlib.pyplot.prism

```
matplotlib.pyplot.prism()
```

Set the colormap to 'prism'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.prism`

## matplotlib.pyplot.psd

```
matplotlib.pyplot.psd(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, nooverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)
```

Plot the power spectral density.

The power spectral density  $P_{xx}$  by Welch's average periodogram method. The vector  $x$  is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The  $|\text{fft}(i)|^2$  of each segment *i* are averaged to compute  $P_{xx}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < \text{NFFT}$ , it will be zero padded to *NFFT*.

### Parameters

**x**

[1-D array or sequence] Array or sequence containing the data

**fs**

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to *NFFT*

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap between segments.

**Fc**

[int, default: 0] The center frequency of  $x$ , which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**return\_line**

[bool, default: False] Whether to include the line object plotted in the returned values.

**Returns****Pxx**

[1-D array] The values for the power spectrum  $P_{xx}$  before scaling (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in  $Pxx$ .

**line**

[*Line2D*] The line created by this function. Only returned if *return\_line* is True.

**Other Parameters****\*\*kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or aa	bool
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or c	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<i>CapStyle</i> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<i>JoinStyle</i> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<i>Figure</i>

Property	Description
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>solid_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>transform</code>	<code>matplotlib.transforms.Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>xdata</code>	1D array
<code>ydata</code>	1D array
<code>zorder</code>	float

**See also:****`specgram`**

Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

**`magnitude_spectrum`**

Plots the magnitude spectrum.

**`csd`**

Plots the spectral density between two signals.

## Notes

For plotting, the power is plotted as  $10 \log_{10}(P_{xx})$  for decibels, though  $P_{xx}$  itself is returned.

## Examples using `matplotlib.pyplot.psd`

### `matplotlib.pyplot.quiver`

`matplotlib.pyplot.quiver(*args, data=None, **kw)`

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

*X, Y* define the arrow locations, *U, V* define the arrow directions, and *C* optionally sets the color.

#### Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale\_units* parameters.

#### Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave *minshaft* alone.

#### Arrow outline

*linewidths* and *edgecolors* can be used to customize the arrow outlines.

#### Parameters

##### **X, Y**

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of  $U$  and  $V$ .

If  $X$  and  $Y$  are 1D but  $U, V$  are 2D,  $X, Y$  are expanded to 2D using  $X, Y = np.meshgrid(X, Y)$ . In this case  $\text{len}(X)$  and  $\text{len}(Y)$  must match the column and row dimensions of  $U$  and  $V$ .

## **U, V**

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations.  $U$  and  $V$  may be masked. Only locations unmasked in  $U, V$ , and  $C$  will be drawn.

## **C**

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of  $C$  must match the number of arrow locations.

## **units**

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy':  $X, Y$  or  $\sqrt{X^2 + Y^2}$  in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width' or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

## **angles**

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if  $U == V$  the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on  $X, Y$  data coordinates.

- 'xy': Arrows point from  $(x, y)$  to  $(x+u, y+v)$ . Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case  $U, V$  is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

### **scale**

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the `scale_units` parameter.

### **scale\_units**

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the `scale` kwarg is *None*, the arrow length unit. Default is *None*.

e.g. `scale_units` is 'inches', `scale` is 2.0, and  $(u, v) = (1, 0)$ , then the vector will be 0.5 inches long.

If `scale_units` is 'width' or 'height', then the vector will be half the width/height of the axes.

If `scale_units` is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with  $u$  and  $v$  having the same units as  $x$  and  $y$ , use `angles='xy'`, `scale_units='xy'`, `scale=1`.

### **width**

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

### **headwidth**

[float, default: 3] Head width as multiple of shaft width.

### **headlength**

[float, default: 5] Head length as multiple of shaft width.

### **headaxislength**

[float, default: 4.5] Head length at shaft intersection.

### **minshaft**

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

### **minlength**

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot**

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the  $X$ ,  $Y$  grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

**color**

[color or color sequence, optional] Explicit color(s) for the arrows. If  $C$  has been set, *color* has no effect.

This is a synonym for the [PolyCollection](#) *facecolor* parameter.

**Other Parameters****\*\*kwargs**

[[PolyCollection](#) properties, optional] All other keyword arguments are passed on to [PolyCollection](#):

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	array-like or scalar or None
<i>animated</i>	bool

#### `Axes.quiverkey`

Add a key to a quiver plot.

### Examples using `matplotlib.pyplot.quiver`

- *Sample plots in Matplotlib*

### `matplotlib.pyplot.quiverkey`

`matplotlib.pyplot.quiverkey(Q, X, Y, U, label, **kw)`

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

#### Parameters

##### **Q**

[`matplotlib.quiver.Quiver`] A *Quiver* object as returned by a call to `quiver()`.

##### **X, Y**

[float] The location of the key.

##### **U**

[float] The length of the key.

**label**

[str] The key label (e.g., length and units of the key).

**angle**

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

**coordinates**

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for  $X$ ,  $Y$ : 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

**color**

[color] Overrides face and edge colors from  $Q$ .

**labelpos**

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

**labelsep**

[float, default: 0.1] Distance in inches between the arrow and the label.

**labelcolor**

[color, default: `rcParams["text.color"]` (default: 'black')] Label color.

**fontproperties**

[dict, optional] A dictionary with keyword arguments accepted by the `FontProperties` initializer: *family*, *style*, *variant*, *size*, *weight*.

**\*\*kwargs**

Any additional keyword arguments are used to override vector properties taken from  $Q$ .

## Examples using `matplotlib.pyplot.quiverkey`

### `matplotlib.pyplot.rc`

#### `matplotlib.pyplot.rc(group, **kwargs)`

Set the current `rcParams`. *group* is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., `(xtick, ytick)`. *kwargs* is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current *rcParams* and is equivalent to:

```
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

Alias	Property
'lw'	'linewidth'
'ls'	'linestyle'
'c'	'color'
'fc'	'facecolor'
'ec'	'edgecolor'
'mew'	'markeredgewidth'
'aa'	'antialiased'

Thus you could abbreviate the above call as:

```
rc('lines', lw=2, c='r')
```

Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size'   : 'larger'}
rc('font', **font) # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or `rcdefaults()` to restore the default *rcParams* after changes.

## Notes

Similar functionality is available by using the normal dict interface, i.e. `rcParams.update({"lines.linewidth": 2, ...})` (but `rcParams.update` does not support abbreviations or grouping).

## Examples using `matplotlib.pyplot.rc`

- *Styling with cycler*

### `matplotlib.pyplot.rc_context`

`matplotlib.pyplot.rc_context(rc=None, fname=None)`

Return a context manager for temporarily changing rcParams.

#### Parameters

##### `rc`

[dict] The rcParams to temporarily set.

##### `fname`

[str or path-like] A file with Matplotlib rc settings. If both `fname` and `rc` are given, settings from `rc` take precedence.

#### See also:

*The matplotlibrc file*

## Examples

Passing explicit values via a dict:

```
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y) # uses 'print.rc'
```

### Examples using `matplotlib.pyplot.rc_context`

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_usetex\_baseline\_test.py
- sphx\_glr\_gallery\_style\_sheets\_style\_sheets\_reference.py
- sphx\_glr\_gallery\_misc\_logos2.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_auto\_ticks.py

### `matplotlib.pyplot.rcdefaults`

`matplotlib.pyplot.rcdefaults()`

Restore the `rcParams` from Matplotlib's internal default style.

Style-blacklisted `rcParams` (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

See also:

`matplotlib.rc_file_defaults`

Restore the `rcParams` from the rc file originally loaded by Matplotlib.

`matplotlib.style.use`

Use a specific style file. Call `style.use('default')` to restore the default style.

### Examples using `matplotlib.pyplot.rcdefaults`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_barh.py
- sphx\_glr\_gallery\_misc\_customize\_rc.py

### `matplotlib.pyplot.rgrids`

`matplotlib.pyplot.rgrids(radial=None, labels=None, angle=None, fmt=None, **kwargs)`

Get or set the radial gridlines on the current polar plot.

Call signatures:

```
lines, labels = rgrids()
lines, labels = rgrids(radial, labels=None, angle=22.5, fmt=None, ...
    **kwargs)
```

When called with no arguments, `rgrids` simply returns the tuple `(lines, labels)`. When called with arguments, the labels will appear at the specified radial distances and angle.

#### Parameters

**radii**

[tuple with floats] The radii for the radial gridlines

**labels**

[tuple with strings or None] The labels to use at each radial gridline. The `matplotlib.ticker.ScalarFormatter` will be used if None.

**angle**

[float] The angular position of the radius labels in degrees.

**fmt**

[str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example '%f'.

**Returns****lines**

[list of `lines.Line2D`] The radial gridlines.

**labels**

[list of `text.Text`] The tick labels.

**Other Parameters****\*\*kwargs**

`kwargs` are optional `Text` properties for the labels.

**See also:**

`pyplot.thetagrids`

`projections.polar.PolarAxes.set_rgrids`

`Axis.get_gridlines`

`Axis.get_ticklabels`

**Examples**

```
# set the locations of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0) )

# set the locations and labels of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0), ('Tom', 'Dick', 'Harry') )
```

### Examples using `matplotlib.pyplot.savefig`

#### `matplotlib.pyplot.savefig`

```
matplotlib.pyplot.savefig(*args, **kwargs)
```

Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

#### Parameters

##### `fname`

[str or path-like or binary file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

If `format` is set, it determines the output format, and the file is saved as `fname`. Note that `fname` is used verbatim, and there is no attempt to make the extension, if any, of `fname` match `format`, and no extension is appended.

If `format` is not set, then the format is inferred from the extension of `fname`, if there is one. If `format` is not set and `fname` has no extension, then the file is saved with `rcParams["savefig.format"]` (default: 'png') and the appropriate extension is appended to `fname`.

#### Other Parameters

##### `dpi`

[float or 'figure', default: `rcParams["savefig.dpi"]`] (default: 'figure')] The resolution in dots per inch. If 'figure', use the figure's dpi value.

##### `quality`

[int, default: `rcParams["savefig.jpeg_quality"]`] (default: 95)] Applicable only if `format` is 'jpg' or 'jpeg', ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

##### `optimize`

[bool, default: False] Applicable only if `format` is 'jpg' or 'jpeg', ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

### **progressive**

[bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

### **facecolor**

[color or 'auto', default: `rcParams["savefig.facecolor"]`] (default: 'auto') The facecolor of the figure. If 'auto', use the current figure facecolor.

### **edgecolor**

[color or 'auto', default: `rcParams["savefig.edgecolor"]`] (default: 'auto') The edgecolor of the figure. If 'auto', use the current figure edgecolor.

### **orientation**

[{'landscape', 'portrait'}] Currently only supported by the postscript backend.

### **papertype**

[str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

### **format**

[str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

### **transparent**

[bool] If *True*, the Axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

### **bbox\_inches**

[str or *Bbox*, default: `rcParams["savefig.bbox"]`] (default: None) Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

### **pad\_inches**

[float, default: `rcParams["savefig.pad_inches"]`] (default: 0.1) Amount of padding around the figure when bbox\_inches is 'tight'.

### **bbox\_extra\_artists**

[list of [Artist](#), optional] A list of extra artists that will be considered when the tight bbox is calculated.

### backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See [The builtin backends](#) for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

### metadata

[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter `metadata` of [print\\_png](#).
- 'pdf' with pdf backend: See the parameter `metadata` of [PdfPages](#).
- 'svg' with svg backend: See the parameter `metadata` of [print\\_svg](#).
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

### pil\_kwarg

[dict, optional] Additional keyword arguments that are passed to [PIL.Image](#).  
`Image.save` when saving the figure.

## Examples using `matplotlib.pyplot.savefig`

- sphx\_glr\_gallery\_misc\_print\_stdout\_sgskip.py
- sphx\_glr\_gallery\_user\_interfaces\_svg\_histogram\_sgskip.py
- sphx\_glr\_gallery\_user\_interfaces\_svg\_tooltip\_sgskip.py

## matplotlib.pyplot.sca

`matplotlib.pyplot.sca(ax)`

Set the current Axes to `ax` and the current Figure to the parent of `ax`.

## Examples using `matplotlib.pyplot.sca`

## matplotlib.pyplot.scatter

```
matplotlib.pyplot.scatter(x, y, s=None, c=None, marker=None, cmap=None,  
                         norm=None, vmin=None, vmax=None, alpha=None,  
                         linewidths=None, *, edgecolors=None, plotnonfinite=False,  
                         data=None, **kwargs)
```

A scatter plot of `y` vs. `x` with varying marker size and/or color.

## Parameters

### x, y

[float or array-like, shape (n, )] The data positions.

### s

[float or array-like, shape (n, ), optional] The marker size in points<sup>\*\*2</sup>. Default is `rcParams['lines.markersize'] ** 2`.

### c

[array-like or list of colors or color, optional] The marker colors. Possible values:

- A scalar or sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2D array in which the rows are RGB or RGBA.
- A sequence of colors of length n.
- A single color format string.

Note that *c* should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. If you want to specify the same RGB or RGBA value for all points, use a 2D array with a single row. Otherwise, value- matching will have precedence in case of a size matching with *x* and *y*.

If you wish to specify a single color for all points prefer the *color* keyword argument.

Defaults to `None`. In that case the marker color is determined by the value of *color*, *facecolor* or *facecolors*. In case those are not specified or `None`, the marker color is determined by the next color of the Axes' current "shape and fill" color cycle. This cycle defaults to `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

### marker

[*MarkerStyle*, default: `rcParams["scatter.marker"]`] (default: '`o`') The marker style. *marker* can be either an instance of the class or the text shorthand for a particular marker. See `matplotlib.markers` for more information about marker styles.

### cmap

[str or *Colormap*, default: `rcParams["image.cmap"]`] (default: '`viridis`') A *Colormap* instance or registered colormap name. *cmap* is only used if *c* is an array of floats.

### norm

[[Normalize](#), default: None] If  $c$  is an array of floats,  $norm$  is used to scale the color data,  $c$ , in the range 0 to 1, in order to map into the colormap  $cmap$ . If *None*, use the default [`colors.Normalize`](#).

**vmin, vmax**

[float, default: None]  $vmin$  and  $vmax$  are used in conjunction with the default  $norm$  to map the color array  $c$  to the colormap  $cmap$ . If *None*, the respective min and max of the color array is used. It is deprecated to use  $vmin/vmax$  when  $norm$  is given.

**alpha**

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewidths**

[float or array-like, default: [`rcParams\["lines.linewidth"\]`](#) (default: 1.5)] The linewidth of the marker edges. Note: The default  $edgecolors$  is 'face'. You may want to change this as well.

**edgecolors**

[{'face', 'none', *None*} or color or sequence of color, default: [`rcParams\["scatter.edgecolors"\]`](#) (default: 'face')] The edge color of the marker. Possible values:

- 'face': The edge color will always be the same as the face color.
- 'none': No patch boundary will be drawn.
- A color or sequence of colors.

For non-filled markers,  $edgecolors$  is ignored. Instead, the color is determined like with 'face', i.e. from  $c$ ,  $colors$ , or  $facecolors$ .

**plotnonfinite**

[bool, default: False] Whether to plot points with nonfinite  $c$  (i.e.  $\inf$ ,  $-\inf$  or  $nan$ ). If True the points are drawn with the  $bad$  colormap color (see [`Colormap.set\_bad`](#)).

**Returns**

[\*\*\*PathCollection\*\*\*](#)

**Other Parameters****\*\*kwargs**

[[`Collection`](#) properties]

**See also:**

## `plot`

To plot scatter plots when markers are identical in size and color.

## Notes

- The `plot` function will be faster for scatterplots where markers don't vary in size or color.
- Any or all of `x`, `y`, `s`, and `c` may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
- Fundamentally, scatter works with 1D arrays; `x`, `y`, `s`, and `c` may be input as N-D arrays, but within scatter they will be flattened. The exception is `c`, which will be flattened only if its size matches the size of `x` and `y`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `s`, `linewidths`, `edgecolors`, `c`, `facecolor`, `facecolors`, `color`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.scatter`

- sphx\_glr\_gallery\_misc\_hyperlinks\_sgskip.py

## `matplotlib.pyplot.sci`

`matplotlib.pyplot.sci(im)`

Set the current image.

This image will be the target of colormap functions like `viridis`, and other functions such as `clim`. The current image is an attribute of the current axes.

## Examples using `matplotlib.pyplot.sci`

- sphx\_glr\_gallery\_shapes\_and\_collections\_line\_collection.py

### matplotlib.pyplot.semilogx

```
matplotlib.pyplot.semilogx(*args, **kwargs)
```

Make a plot with log scaling on the x axis.

Call signatures:

```
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the x-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `base`, `subs`, and `nonpositive` control the x-axis properties. They are just forwarded to `Axes.set_xscale`.

#### Parameters

##### base

[float, default: 10] Base of the x logarithm.

##### subs

[array-like, optional] The location of the minor xticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale` for details.

##### nonpositive

[{'mask', 'clip'}, default: 'mask'] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

#### Returns

##### list of `Line2D`

Objects representing the plotted data.

#### Other Parameters

##### \*\*kwargs

All parameters supported by `plot`.

## Examples using `matplotlib.pyplot.semilogx`

- Sample plots in Matplotlib

### `matplotlib.pyplot.semilogy`

`matplotlib.pyplot.semilogy(*args, **kwargs)`

Make a plot with log scaling on the y axis.

Call signatures:

```
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the y-axis to log scaling. All of the concepts and parameters of `plot` can be used here as well.

The additional parameters `base`, `subs`, and `nonpositive` control the y-axis properties. They are just forwarded to `Axes.set_yscale`.

#### Parameters

##### `base`

[float, default: 10] Base of the y logarithm.

##### `subs`

[array-like, optional] The location of the minor yticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot.

See `Axes.set_yscale` for details.

##### `nonpositive`

[{'mask', 'clip'}, default: 'mask'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

#### Returns

##### `list of Line2D`

Objects representing the plotted data.

#### Other Parameters

##### `**kwargs`

All parameters supported by `plot`.

### Examples using `matplotlib.pyplot.semilogy`

- *Sample plots in Matplotlib*

### `matplotlib.pyplot.set_cmap`

`matplotlib.pyplot.set_cmap(cmap)`

Set the default colormap, and applies it to the current image if any.

#### Parameters

##### `cmap`

[*Colormap* or str] A colormap instance or the name of a registered colormap.

#### See also:

[\*colormaps\*](#)

[\*matplotlib.cm.register\\_cmap\*](#)

[\*matplotlib.cm.get\\_cmap\*](#)

### Examples using `matplotlib.pyplot.set_cmap`

### `matplotlib.pyplot.setp`

`matplotlib.pyplot.setp(obj, *args, **kwargs)`

Set one or more properties on an *Artist*, or list allowed values.

#### Parameters

##### `obj`

[*Artist* or list of *Artist*] The artist(s) whose properties are being set or queried. When setting properties, all artists are affected; when querying the allowed values, only the first instance in the sequence is queried.

For example, two lines can be made thicker and red with a single call:

```
>>> x = arange(0, 1, 0.01)
>>> lines = plot(x, sin(2*pi*x), x, sin(4*pi*x))
>>> setp(lines, linewidth=2, color='r')
```

##### `file`

[file-like, default: `sys.stdout`] Where `setp` writes its output when asked to list allowed values.

```
>>> with open('output.log') as file:  
...     setp(line, file=file)
```

The default, `None`, means `sys.stdout`.

### \*args, \*\*kwargs

The properties to set. The following combinations are supported:

- Set the linestyle of a line to be dashed:

```
>>> line, = plot([1, 2, 3])  
>>> setp(line, linestyle='--')
```

- Set multiple properties at once:

```
>>> setp(line, linewidth=2, color='r')
```

- List allowed values for a line's linestyle:

```
>>> setp(line, 'linestyle')  
linestyle: {'-', '--', '-.', ':', '', (offset, on-off-  
    seq), ...}
```

- List all properties that can be set, and their allowed values:

```
>>> setp(line)  
agg_filter: a filter function, ...  
[long output listing omitted]
```

`setp` also supports MATLAB style string/value pairs. For example, the following are equivalent:

```
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB  
  ↵style  
>>> setp(lines, linewidth=2, color='r')           # Python  
  ↵style
```

### See also:

[getp](#)

### Examples using `matplotlib.pyplot.show`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

### `matplotlib.pyplot.show`

`matplotlib.pyplot.show(*, block=None)`

Display all open figures.

#### Parameters

##### `block`

[bool, optional] Whether to wait for all figures to be closed before returning.

If `True` block and run the GUI main loop until all figure windows are closed.

If `False` ensure that all figure windows are displayed and return immediately. In this case, you are responsible for ensuring that the event loop is running to have responsive figures.

Defaults to `True` in non-interactive mode and to `False` in interactive mode (see `pyplot.isinteractive`).

#### See also:

##### `ion`

Enable interactive mode, which shows / updates the figure after every plotting command, so that calling `show()` is not necessary.

##### `ioff`

Disable interactive mode.

##### `savefig`

Save the figure to an image file instead of showing it on screen.

### Notes

#### Saving figures to file and showing a window at the same time

If you want an image file as well as a user interface window, use `pyplot.savefig` before `pyplot.show`. At the end of (a blocking) `show()` the figure is closed and thus unregistered from `pyplot`. Calling `pyplot.savefig` afterwards would save a new and thus empty figure. This limitation of command order does not apply if the show is non-blocking or if you keep a reference to the figure and use `Figure.savefig`.

#### Auto-show in jupyter notebooks

The jupyter backends (activated via `%matplotlib inline`, `%matplotlib notebook`, or `%matplotlib widget`), call `show()` at the end of every cell by default. Thus, you usually don't have to call it explicitly there.

## Examples using `matplotlib.pyplot.show`

- `sphx_glr_gallery_text_labels_and_annotations_font_family_rc_sgskip.py`
- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`
- `sphx_glr_gallery_event_handling_pong_sgskip.py`
- `sphx_glr_gallery_misc_multiprocess_sgskip.py`
- `sphx_glr_gallery_user_interfaces_pylab_with_gtk_sgskip.py`
- `sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py`
- `sphx_glr_gallery_widgets_lasso_selector_demo_sgskip.py`

## `matplotlib.pyplot.specgram`

```
matplotlib.pyplot.specgram(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, nooverlap=None, cmap=None, xextent=None, pad_to=None, sides=None, scale_by_freq=None, mode=None, scale=None, vmin=None, vmax=None, *, data=None, **kwargs)
```

Plot a spectrogram.

Compute and plot a spectrogram of data in `x`. Data are split into `NFFT` length segments and the spectrum of each section is computed. The windowing function `window` is applied to each segment, and the amount of overlap of each segment is specified with `noverlap`. The spectrogram is plotted as a colormap (using `imshow`).

### Parameters

#### `x`

[1-D array or sequence] Array or sequence containing the data.

#### `Fs`

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.

#### `window`

[callable or ndarray, default: `window_hanning`] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed

as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to *NFFT*.

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz<sup>-1</sup>. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**mode**

[{'default', 'psd', 'magnitude', 'angle', 'phase'}] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

**noverlap**

[int, default: 128] The number of points of overlap between blocks.

**scale**

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale. When *mode* is 'psd', this is dB power ( $10^*$

`log10`). Otherwise this is dB amplitude ( $20 * \log10$ ). 'default' is 'dB' if `mode` is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if `mode` is 'angle' or 'phase'.

**Fc**

[int, default: 0] The center frequency of `x`, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**cmap**

[*Colormap*, default: `rcParams["image.cmap"]`] (default: 'viridis')

**extent**

[*None* or (`xmin`, `xmax`)] The image extent along the x-axis. The default sets `xmin` to the left border of the first bin (*spectrum* column) and `xmax` to the right border of the last bin. Note that for  $noverlap > 0$  the width of the bins is smaller than those of the segments.

**\*\*kwargs**

Additional keyword arguments are passed on to `imshow` which makes the spectrogram image. The origin keyword argument is not supported.

**Returns****spectrum**

[2D array] Columns are the periodograms of successive segments.

**freqs**

[1-D array] The frequencies corresponding to the rows in *spectrum*.

**t**

[1-D array] The times corresponding to midpoints of segments (i.e., the columns in *spectrum*).

**im**

[*AxesImage*] The image created by `imshow` containing the spectrogram.

**See also:****psd**

Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

**magnitude\_spectrum**

A single spectrum, similar to having a single segment when `mode` is 'magnitude'. Plots a line instead of a colormap.

### `angle_spectrum`

A single spectrum, similar to having a single segment when *mode* is 'angle'. Plots a line instead of a colormap.

### `phase_spectrum`

A single spectrum, similar to having a single segment when *mode* is 'phase'. Plots a line instead of a colormap.

## Notes

The parameters *detrend* and *scale\_by\_freq* do only apply when *mode* is set to 'psd'.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

---

## Examples using `matplotlib.pyplot.specgram`

- *Sample plots in Matplotlib*

## `matplotlib.pyplot.spring`

`matplotlib.pyplot.spring()`

Set the colormap to 'spring'.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.spring`

## `matplotlib.pyplot.spy`

`matplotlib.pyplot.spy(Z, precision=0, marker=None, markersize=None, aspect='equal', origin='upper', **kwargs)`

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

### Image style

If `marker` and `markersize` are `None`, `imshow` is used. Any extra remaining keyword arguments are passed to this method.

### Marker style

If `Z` is a `scipy.sparse.spmatrix` or `marker` or `markersize` are `None`, a `Line2D` object will be returned with the value of `marker` determining the marker type, and any remaining keyword arguments passed to `plot`.

### Parameters

#### `Z`

`[(M, N) array-like]` The array to be plotted.

#### `precision`

`[float or 'present', default: 0]` If `precision` is 0, any non-zero value will be plotted. Otherwise, values of  $|Z| > precision$  will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

#### `aspect`

`[{'equal', 'auto', None} or float, default: 'equal']` The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.
- `None`: Use `rcParams["image.aspect"]` (default: 'equal').

#### `origin`

`[{'upper', 'lower'}, default: rcParams["image.origin"] (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention 'upper' is typically used for matrices and images.`

### Returns

#### `AxesImage` or `Line2D`

The return type depends on the plotting style (see above).

### Other Parameters

#### `**kwargs`

The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of `imshow`:

- `cmap`
- `alpha`
- `url`
- any `Artist` properties (passed on to the `AxesImage`)

For the marker style, you can pass any `Line2D` property except for `linestyle`:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n,
<code>alpha</code>	scalar or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
<code>dash_joinstyle</code>	<code>JoinStyle</code> or {'miter', 'round', 'bevel'}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<code>figure</code>	<code>Figure</code>
<code>fillstyle</code>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>linestyle</code> or <code>ls</code>	{'-', '--', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code> or <code>lw</code>	float
<code>marker</code>	marker style string, <code>Path</code> or <code>MarkerStyle</code>
<code>markeredgecolor</code> or <code>mec</code>	color
<code>markeredgewidth</code> or <code>mew</code>	float
<code>markerfacecolor</code> or <code>mfc</code>	color
<code>markerfacecoloralt</code> or <code>mfcalt</code>	color
<code>markersize</code> or <code>ms</code>	float
<code>markevery</code>	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	float or callable[[Artist, Event], tuple[bool, dict]]
<code>pickradius</code>	float
<code>rasterized</code>	bool
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>solid_capstyle</code>	<code>CapStyle</code> or {'butt', 'projecting', 'round'}
